

An Introduction to the Smith Ecophysiology Lab: Physiology for Understanding Larger Scale Processes

Nick Smith

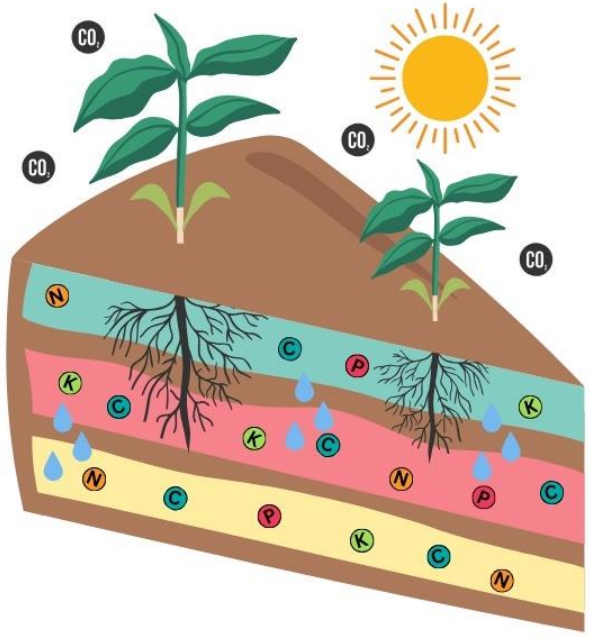

School of Biological Sciences

University of Nebraska - Lincoln

nsmith87@unl.edu

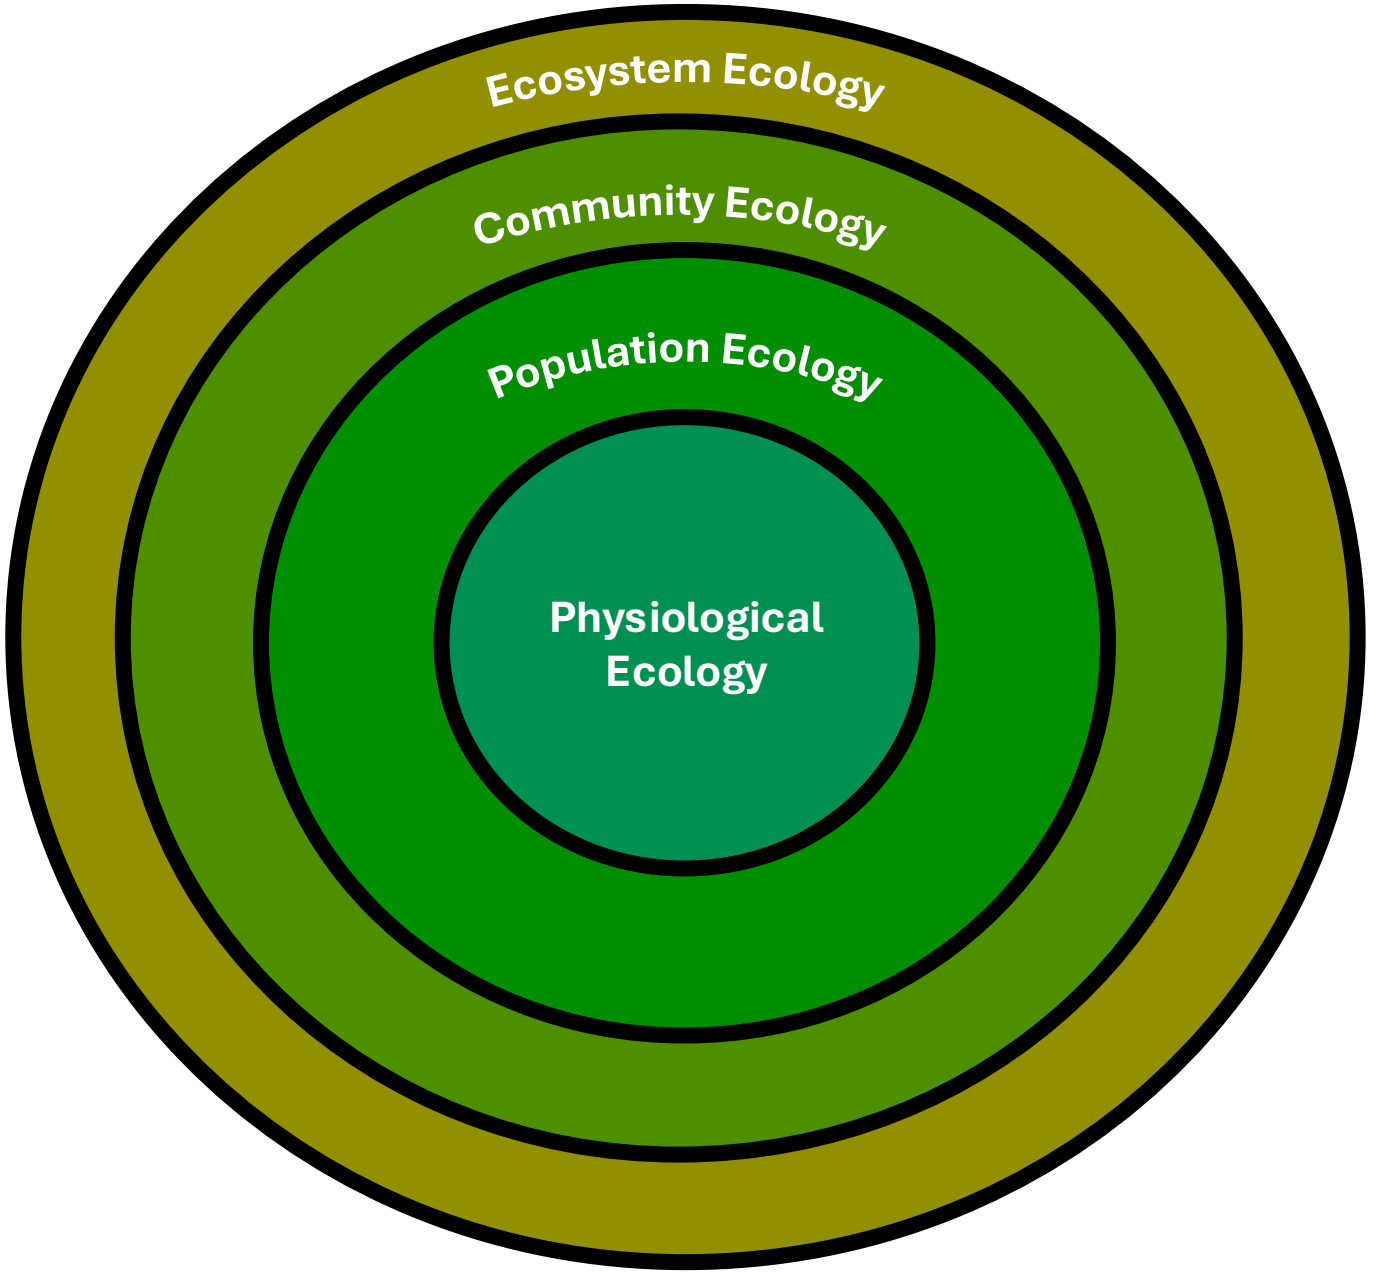

PhUnKY Lab

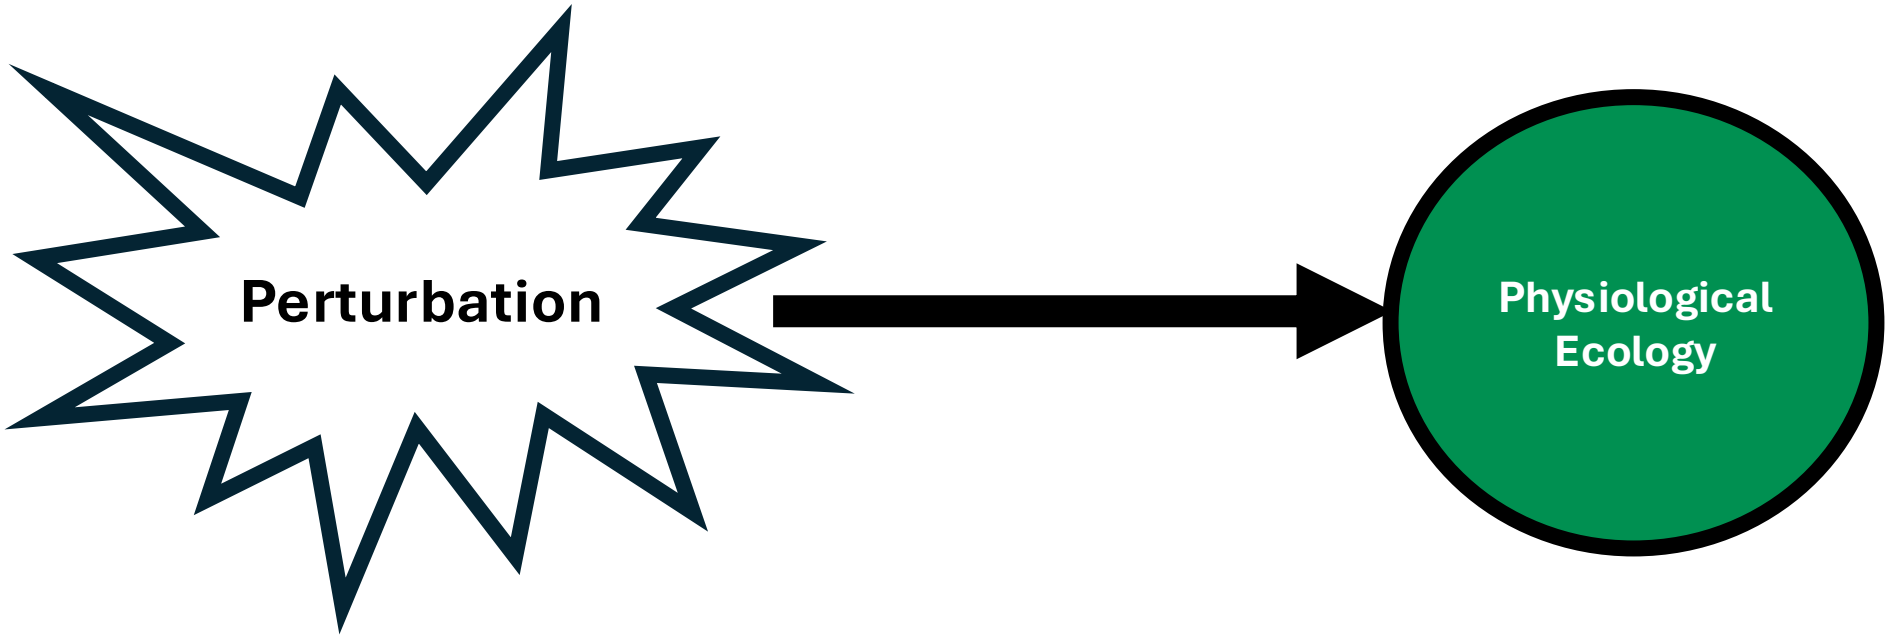

Physiology for Understanding and Knowledge in EcologY

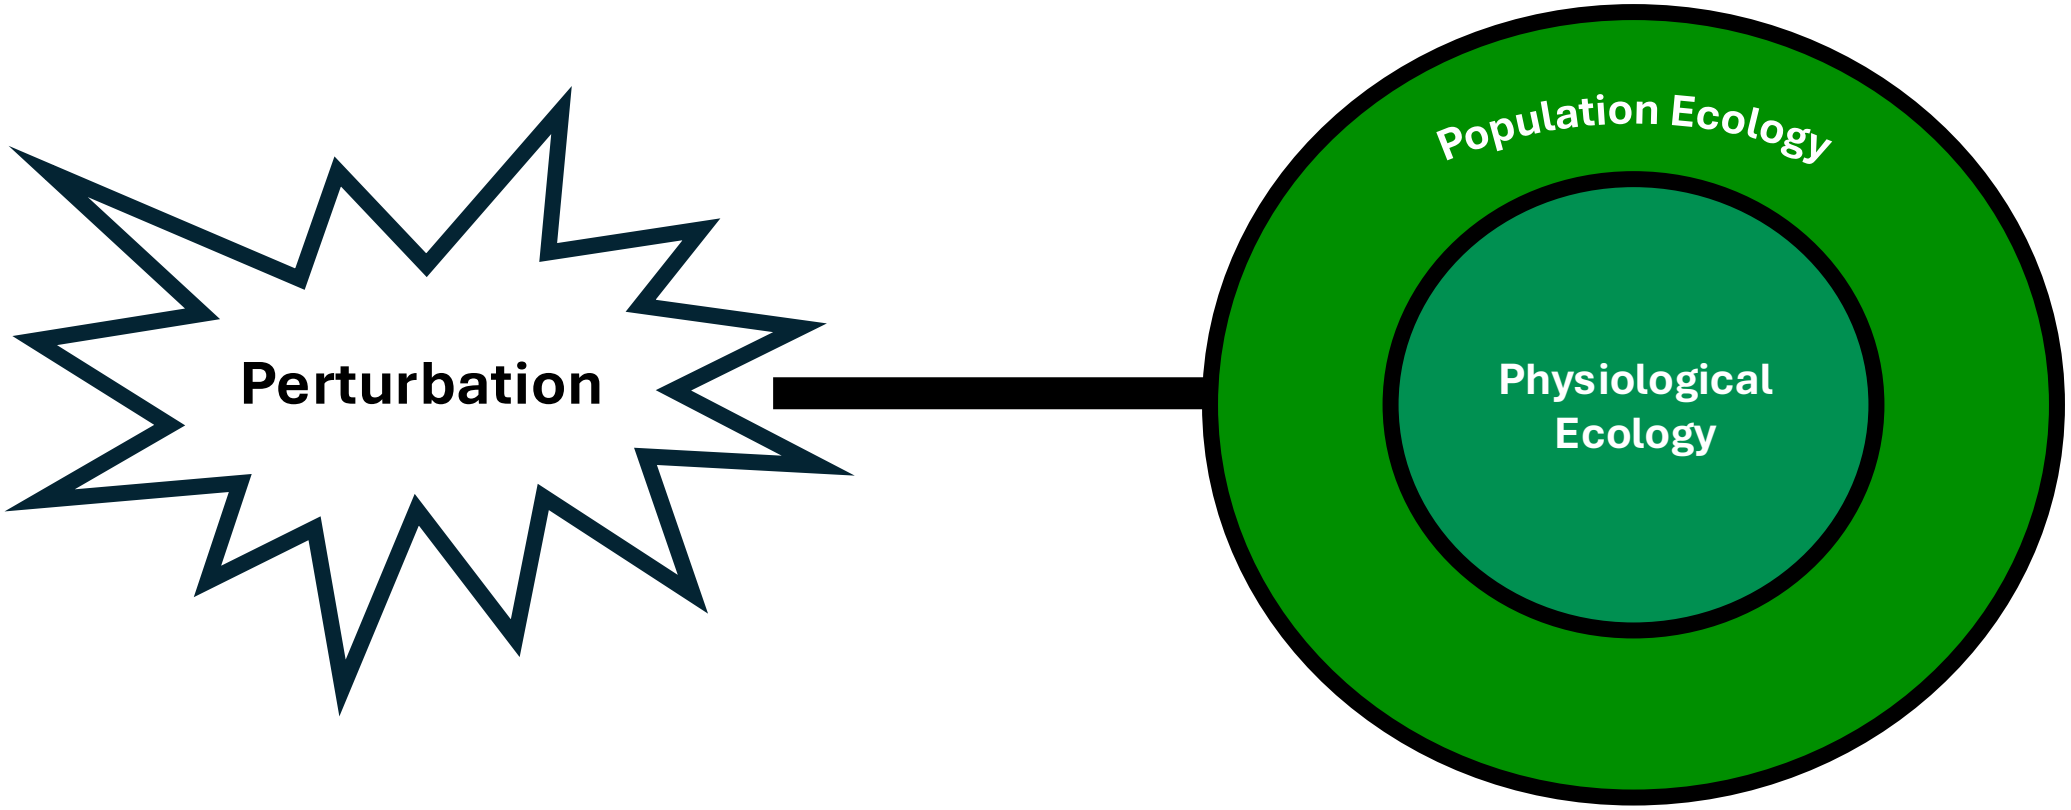

smithecophyslab.com

Ecological scales

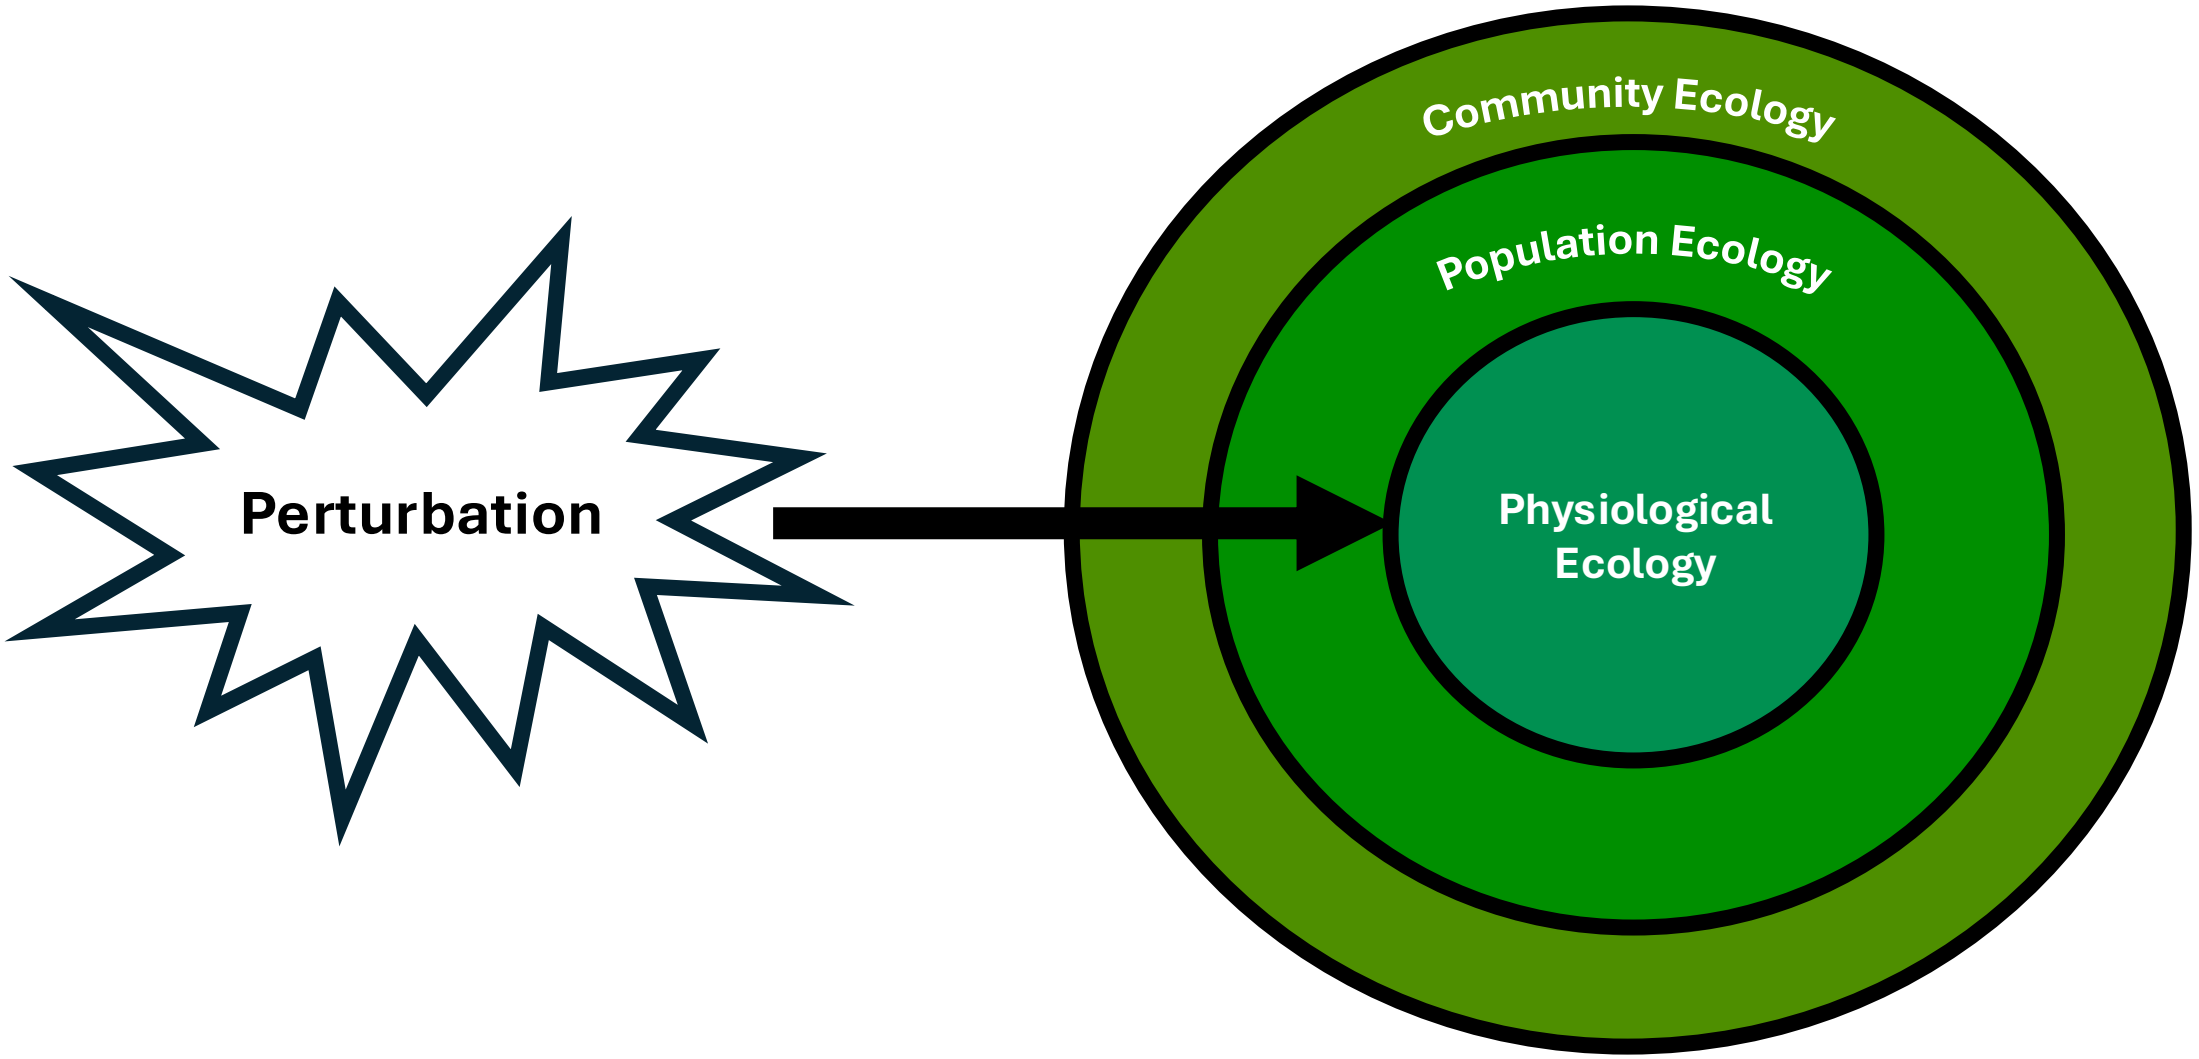

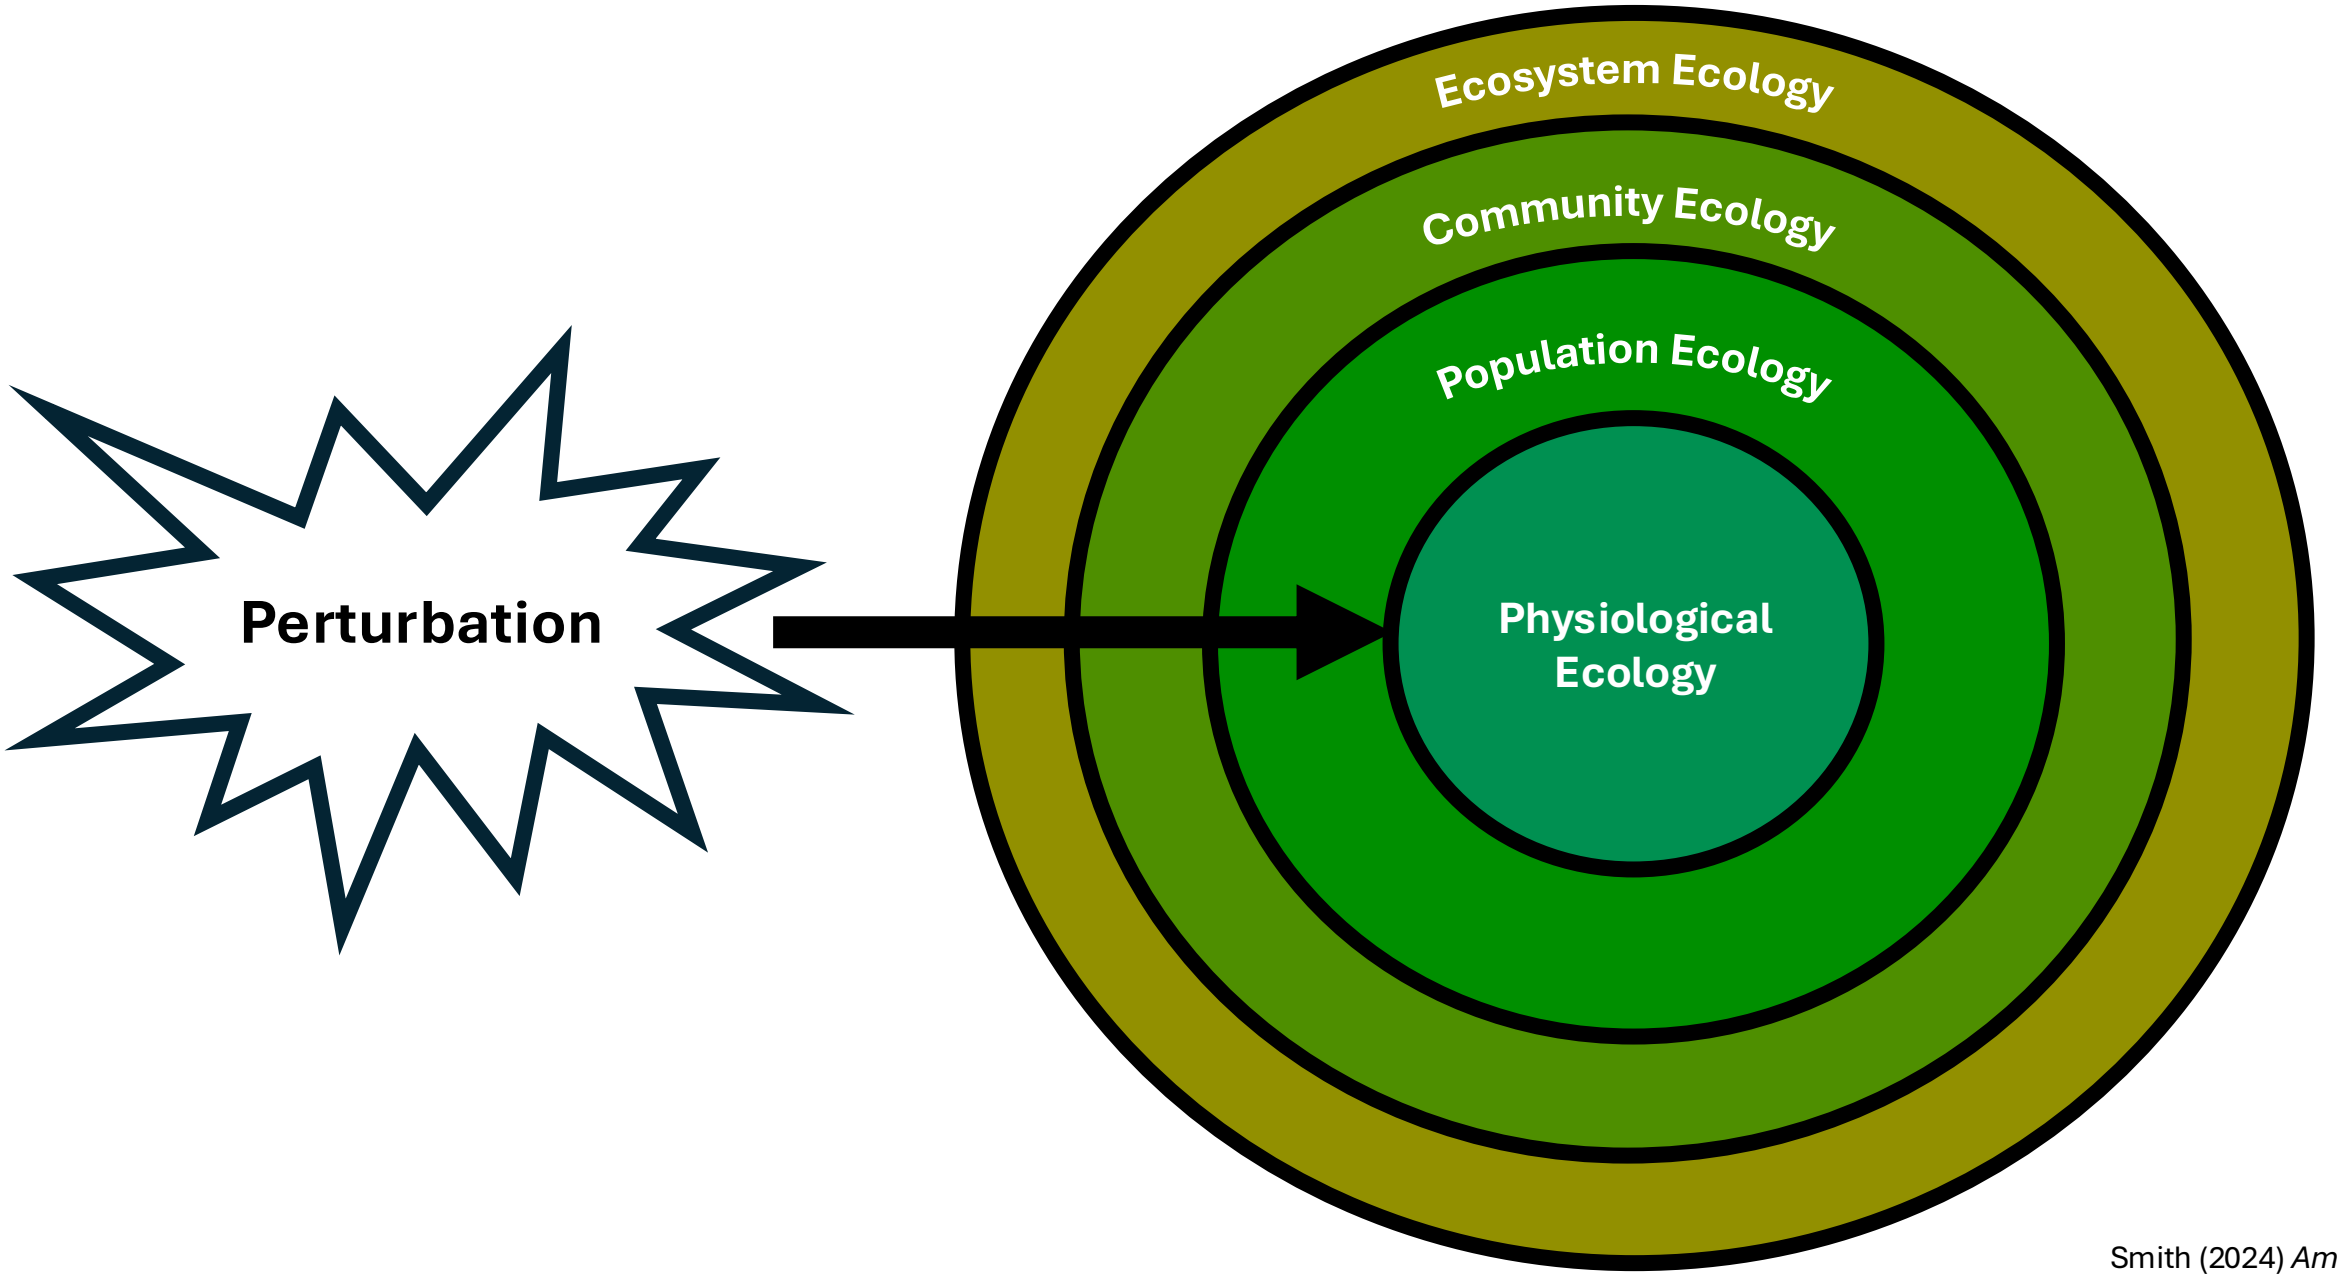

Smith (2024) *Am J Botany*

Smith (2024) *Am J Botany*

Smith (2024) *Am J Botany*

Smith (2024) *Am J Botany*

Structure of the talk

- **Short vignettes** illustrating connections between physiological and larger scale ecological processes under different **perturbations**
- Goal is to **highlight different questions and approaches**
- Would be happy to discuss any in more detail after the talk

Approach icons

Manipulation experiments

Field observations

Theory development

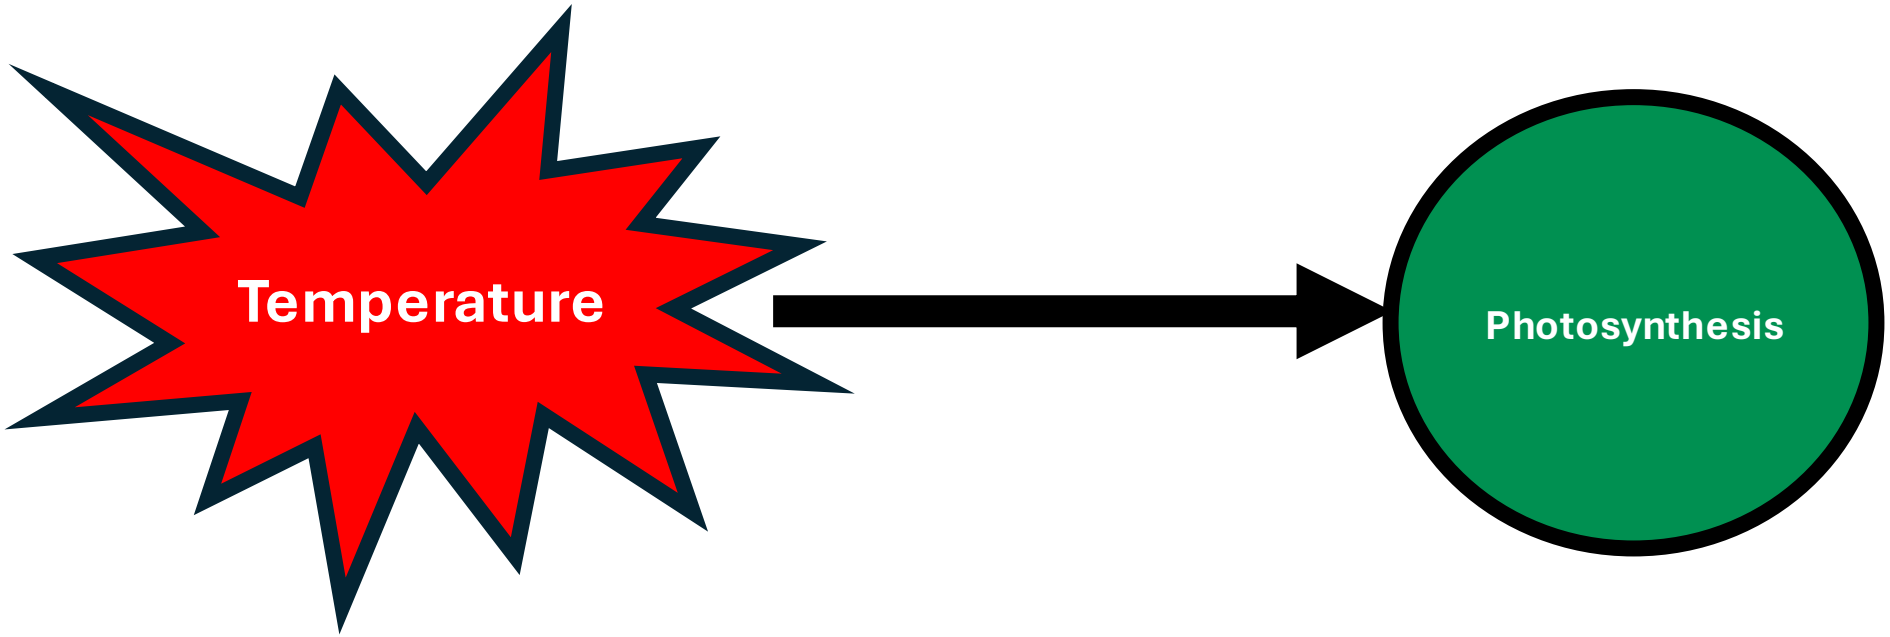

Process-based modeling

Perturbation vignettes

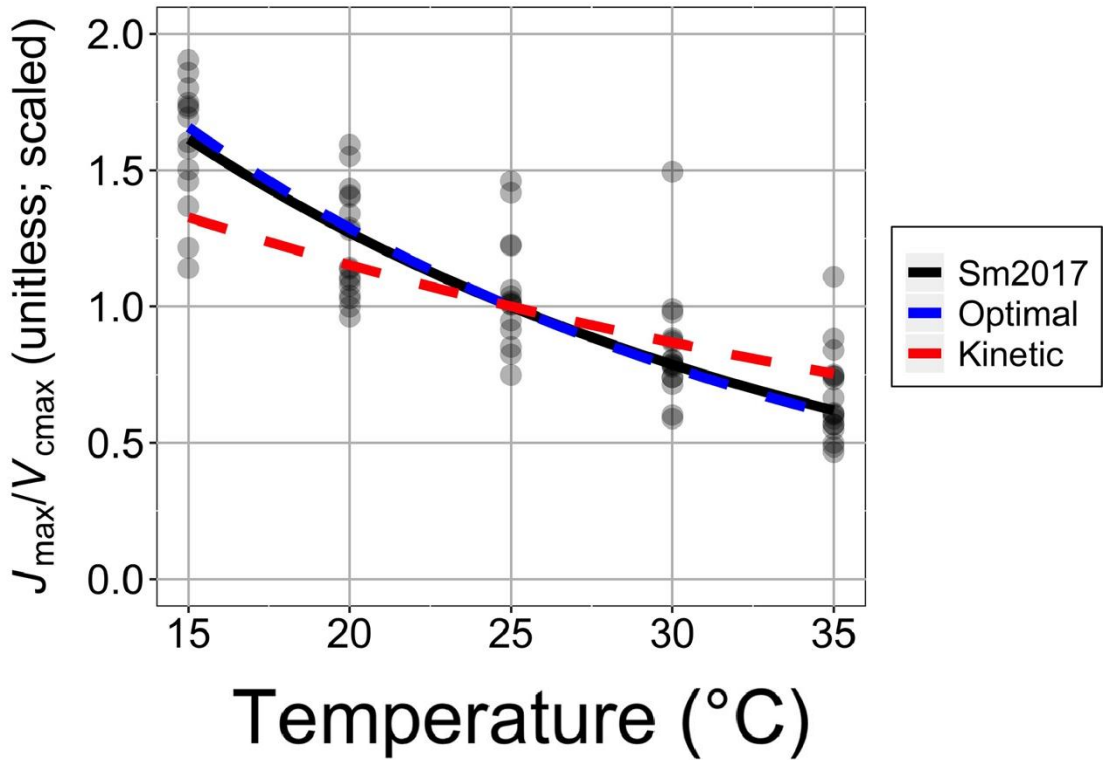

- **Temperature → global carbon and energy fluxes**
- **CO_2 → plant-nutrient dynamics**
- **Soil fertility → population dynamics**
- **Environmental heterogeneity → community dynamics**
- **Invasion → mycorrhizal symbioses**

Perturbation vignettes

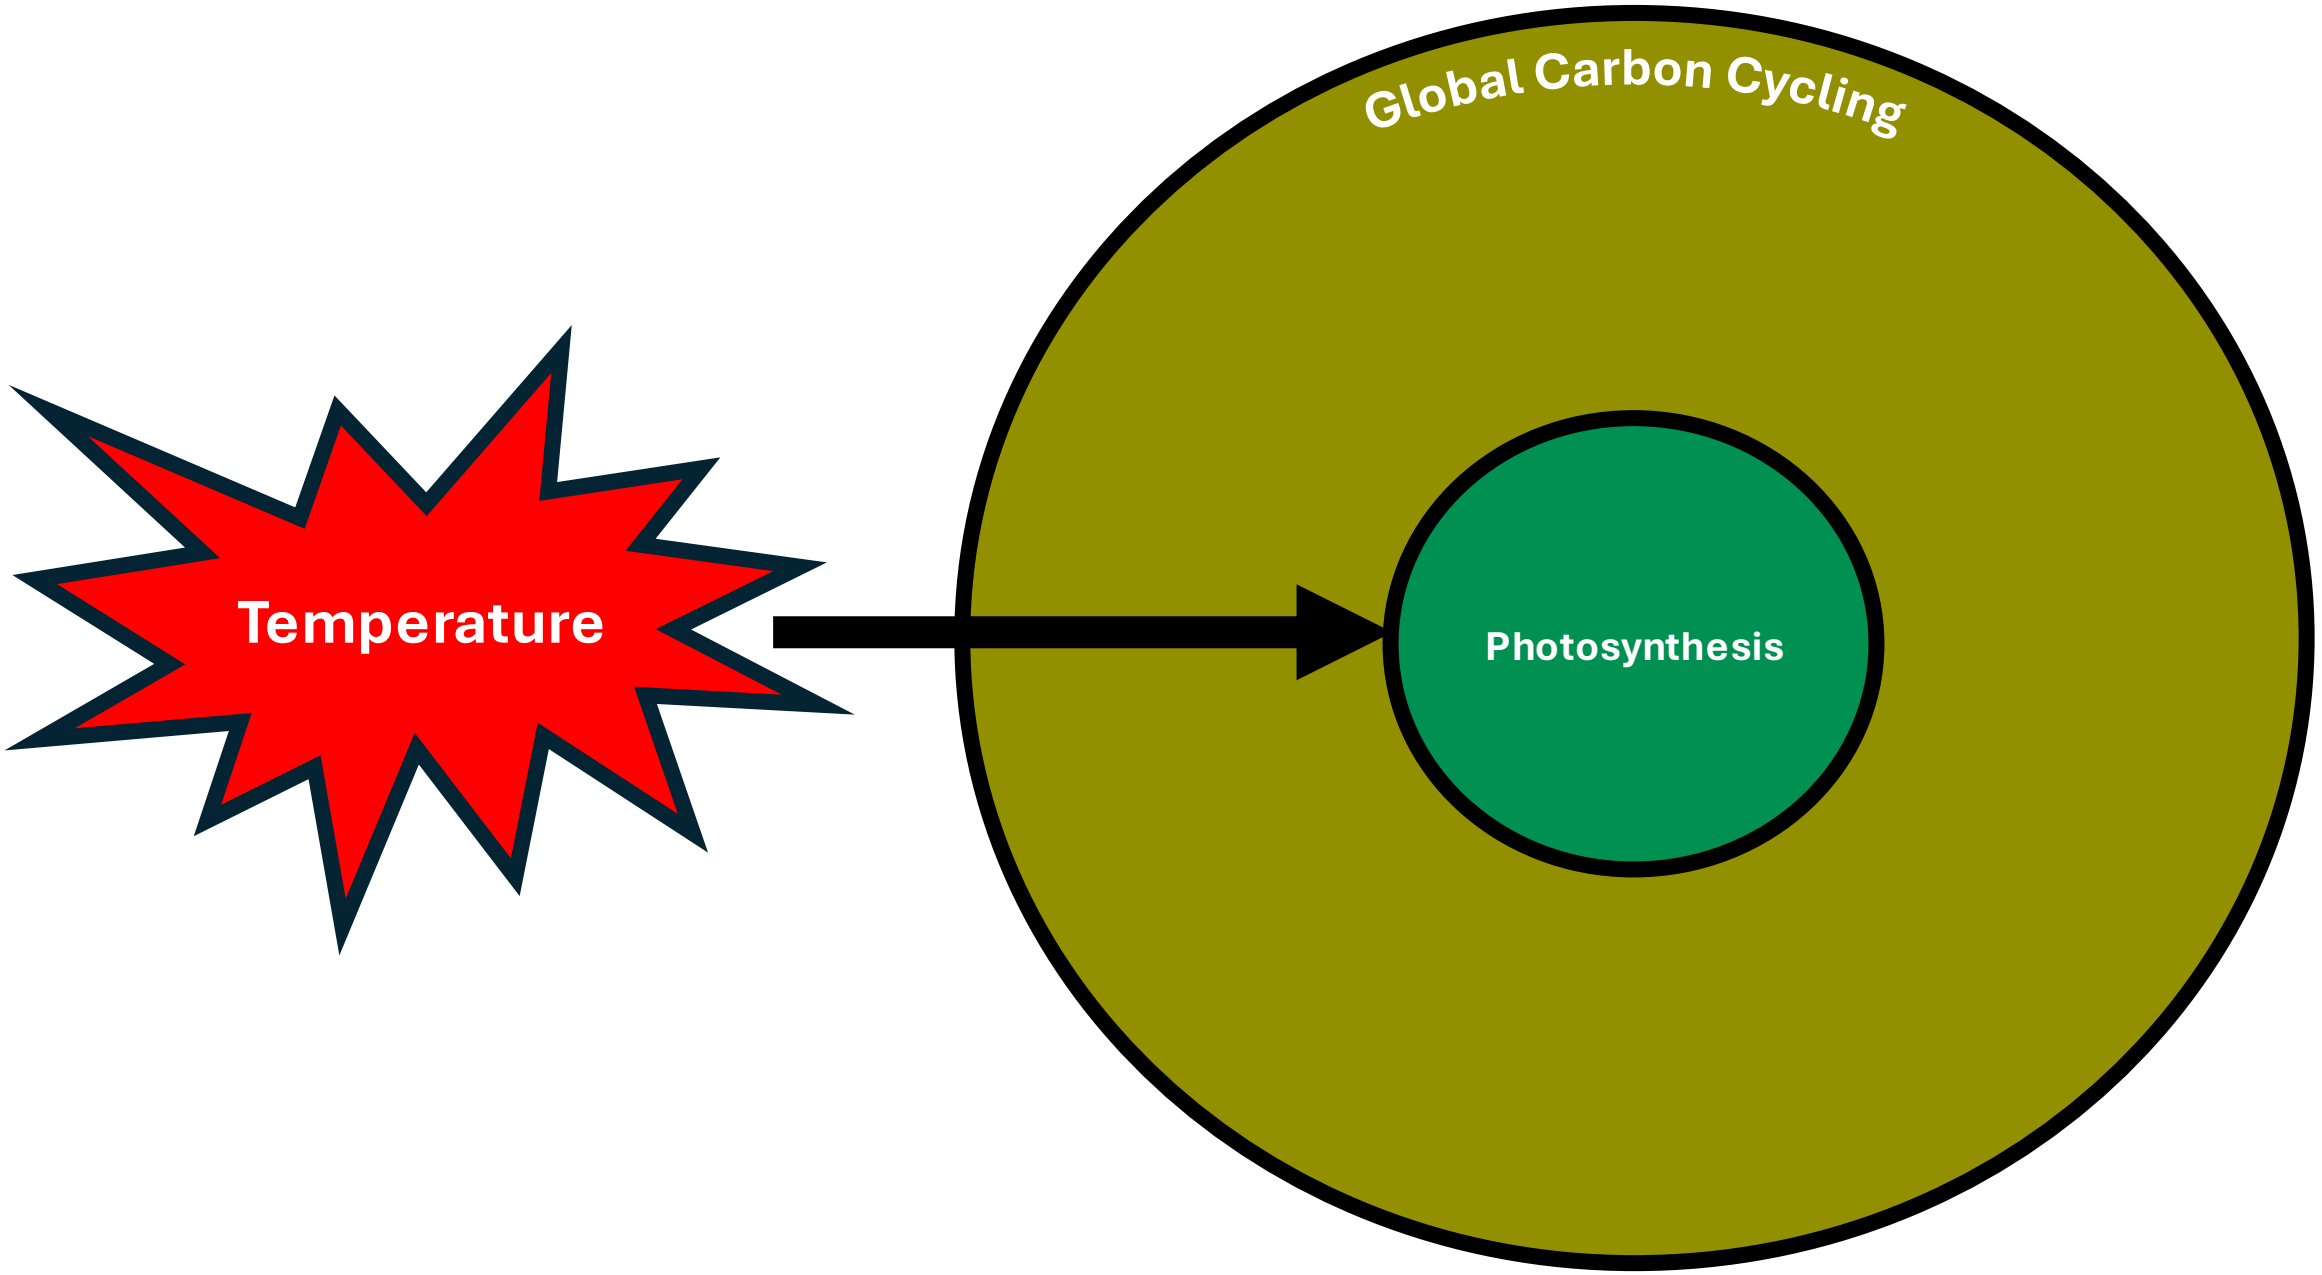

- **Temperature** → global carbon and energy fluxes
- **CO_2** → soil nutrient dynamics
- **Soil fertility** → **population dynamics**
- **Environmental heterogeneity** → **community dynamics**
- **Invasion** → mycorrhizal symbioses

Temperature
Photosynthesis

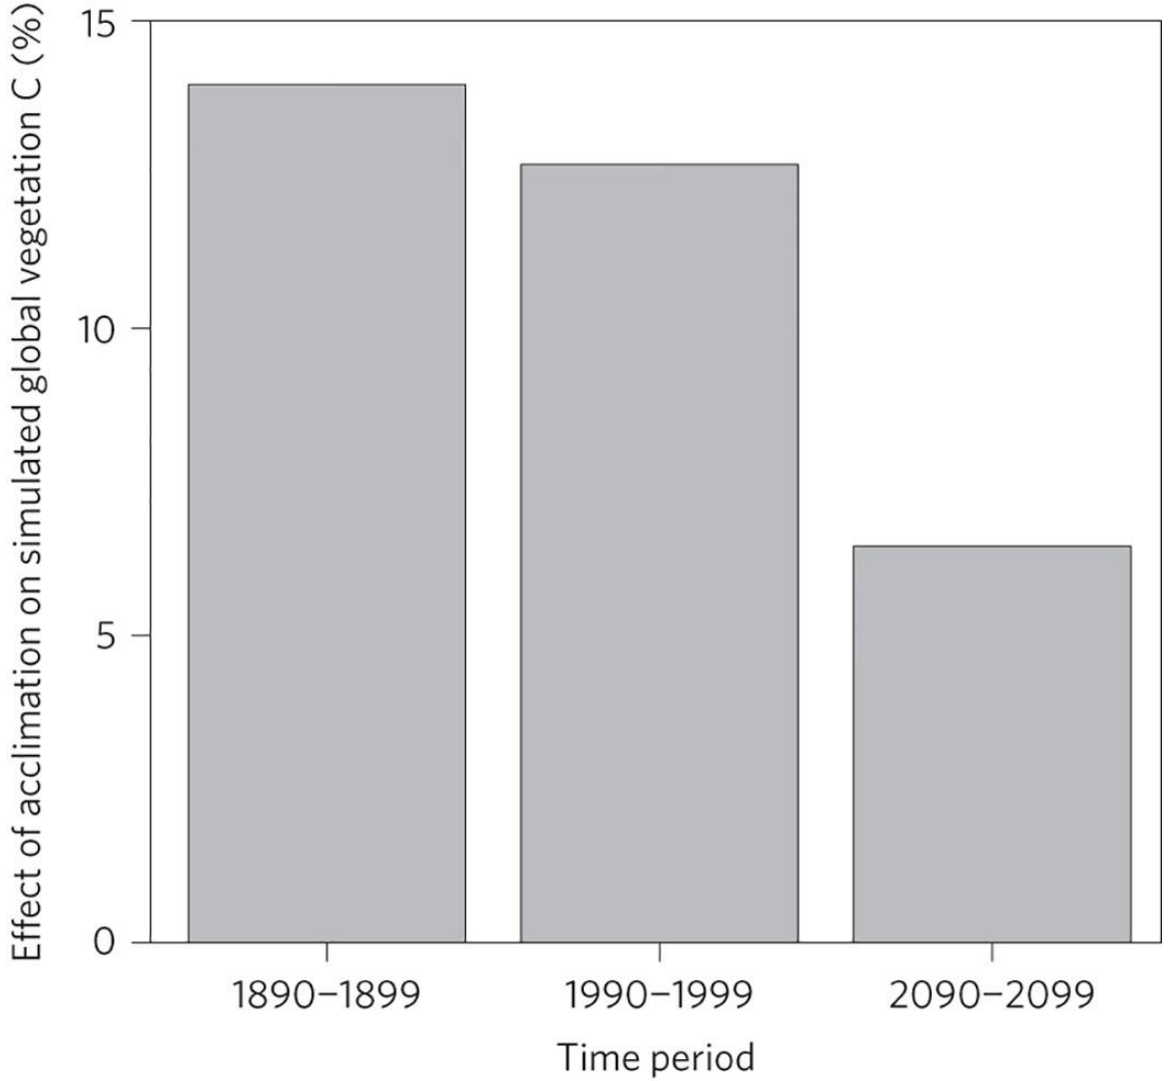

Photosynthesis shows strong and predictable acclimation responses to temperature

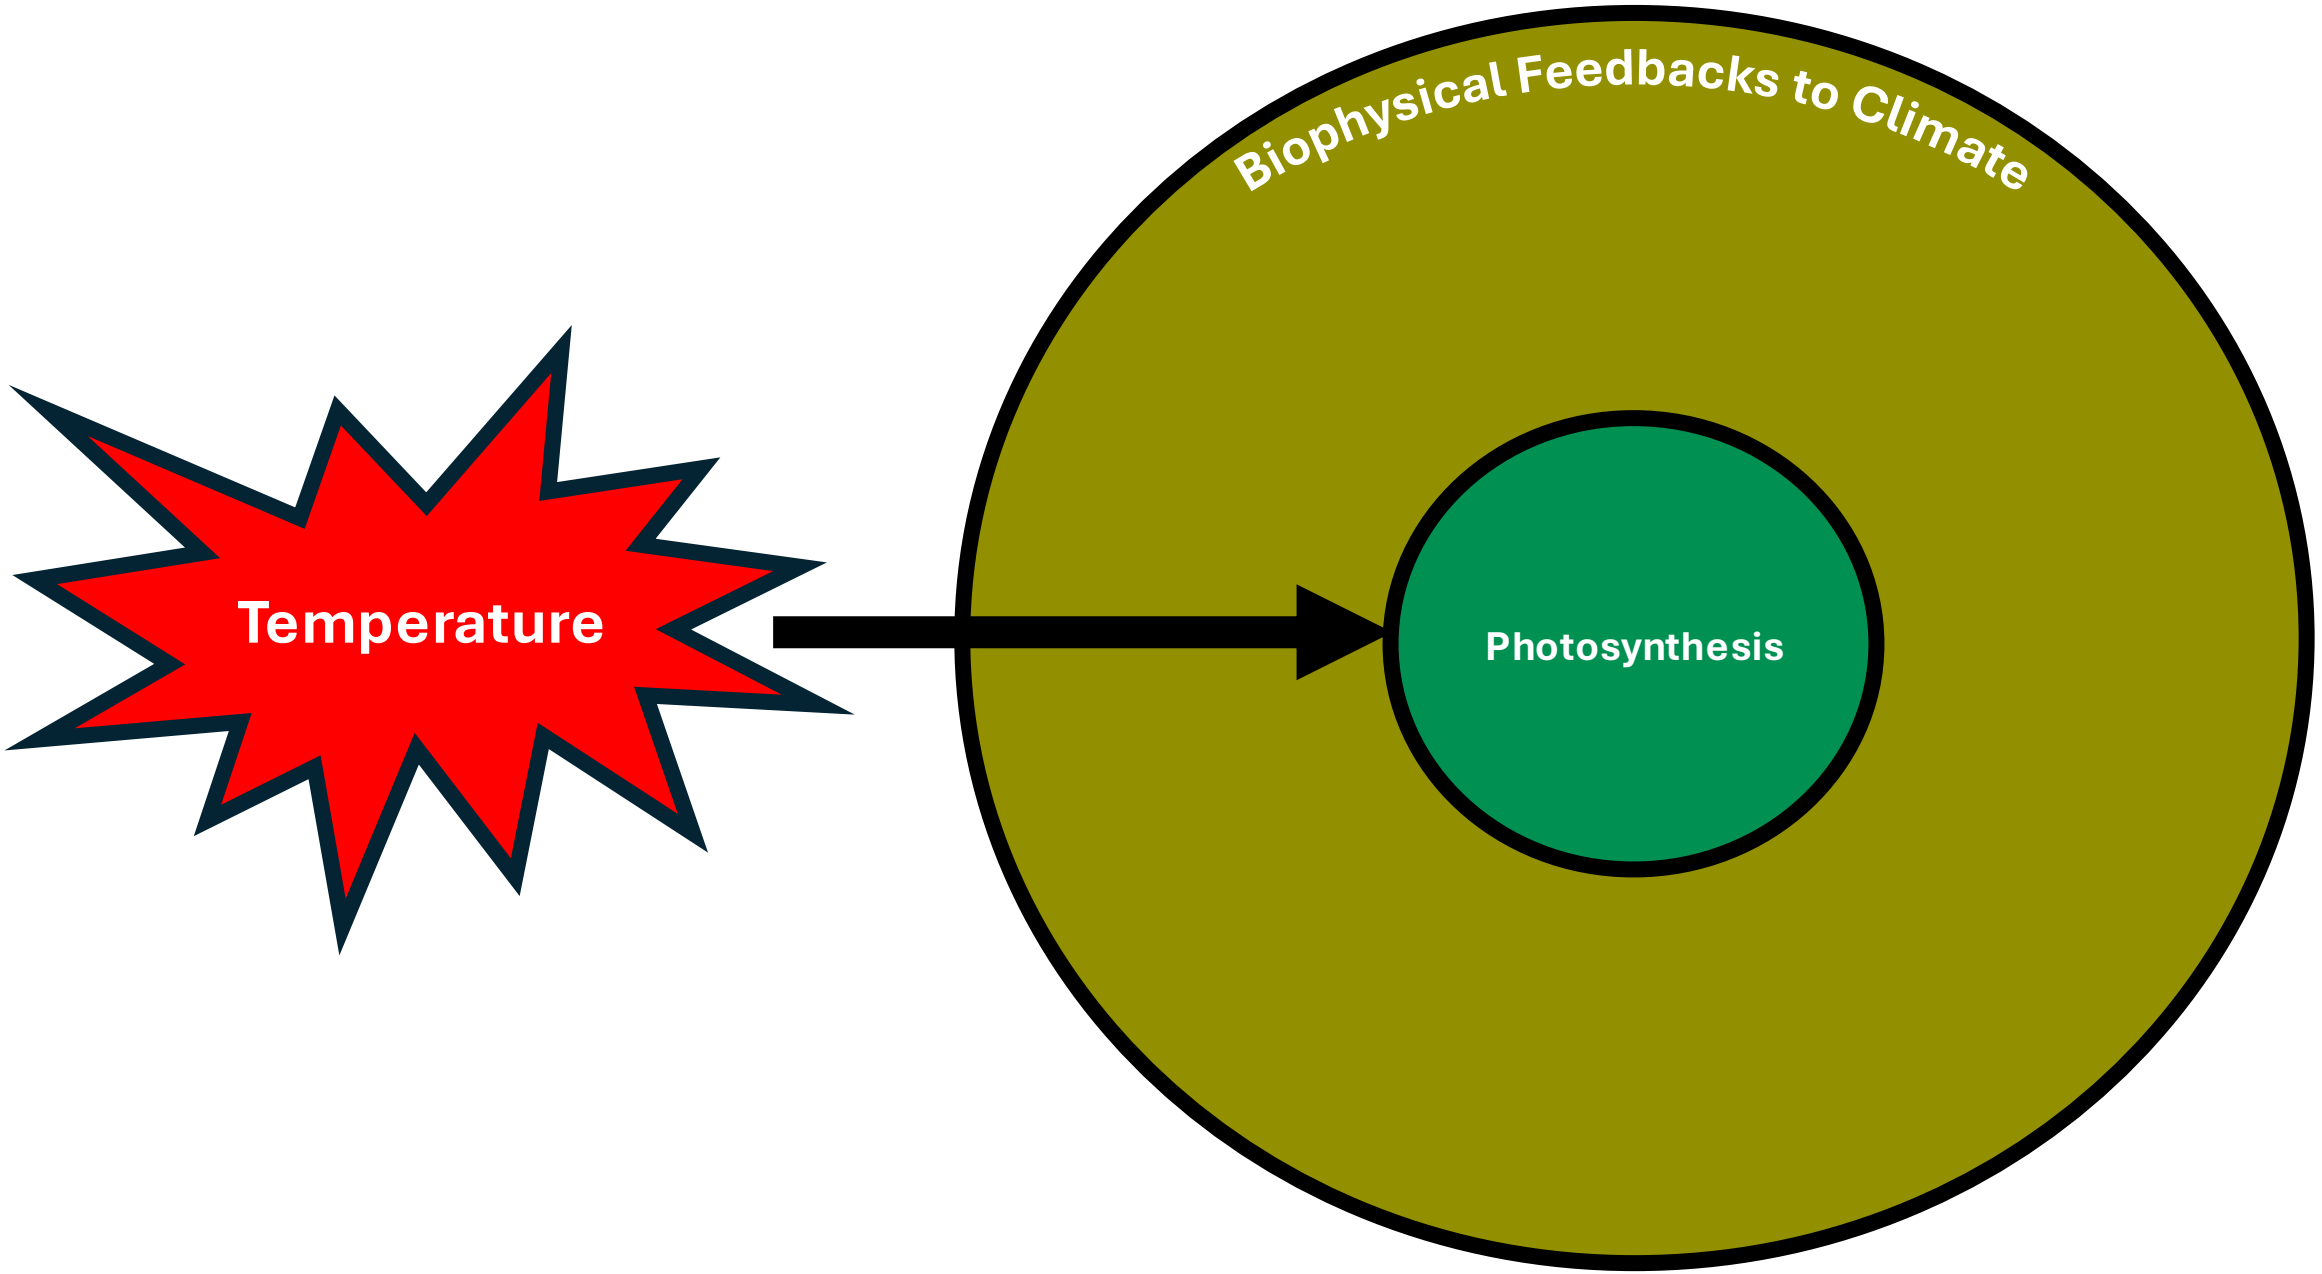

Smith and Keenan (2020) *Glob Change Bio*

Global Carbon Cycling
Temperature
Photosynthesis

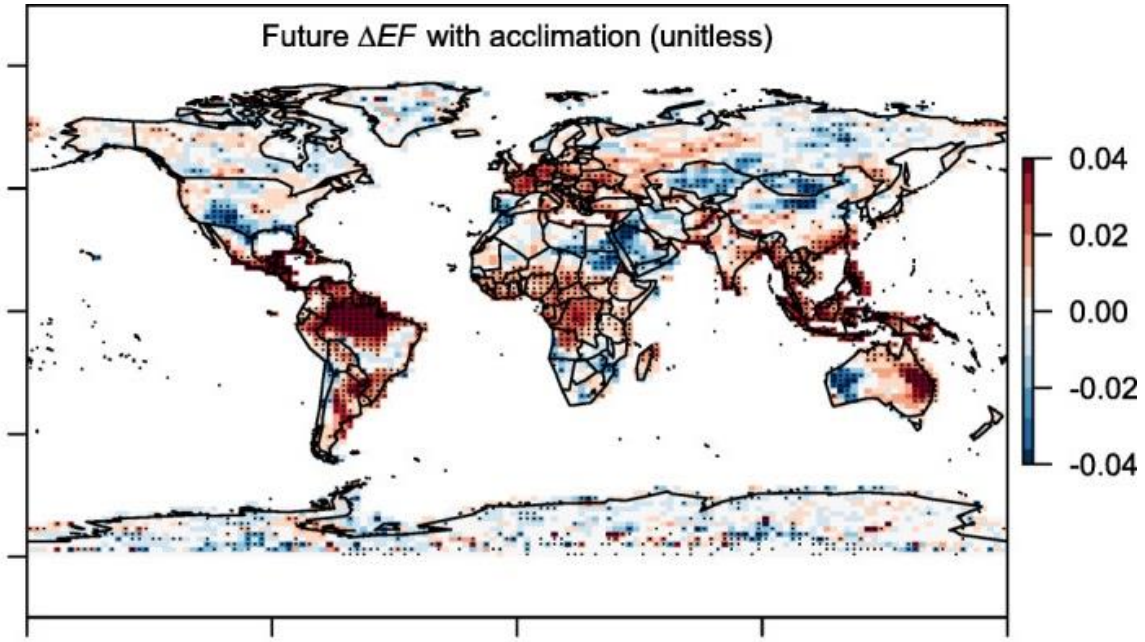

Photosynthetic temperature acclimation increases simulated global vegetation carbon

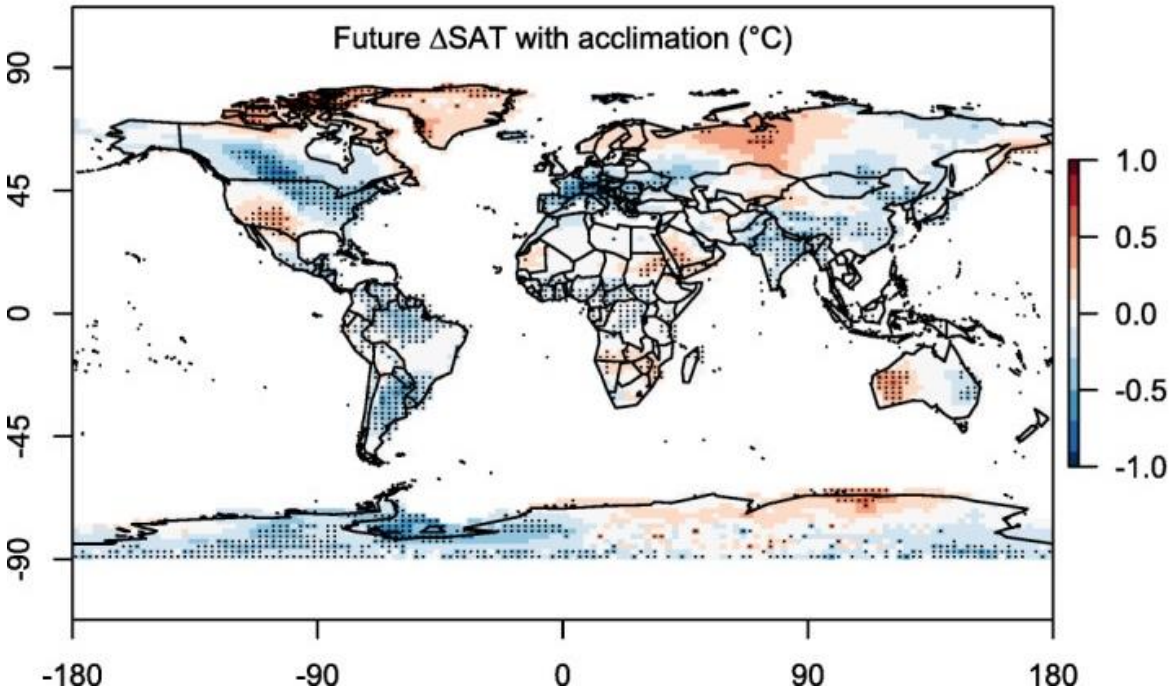

Smith et al. (2016) *Nat Clim Change*

Biophysical Feedbacks to Climate
Temperature
Photosynthesis

Photosynthetic temperature acclimation changes transpiration and air temperature

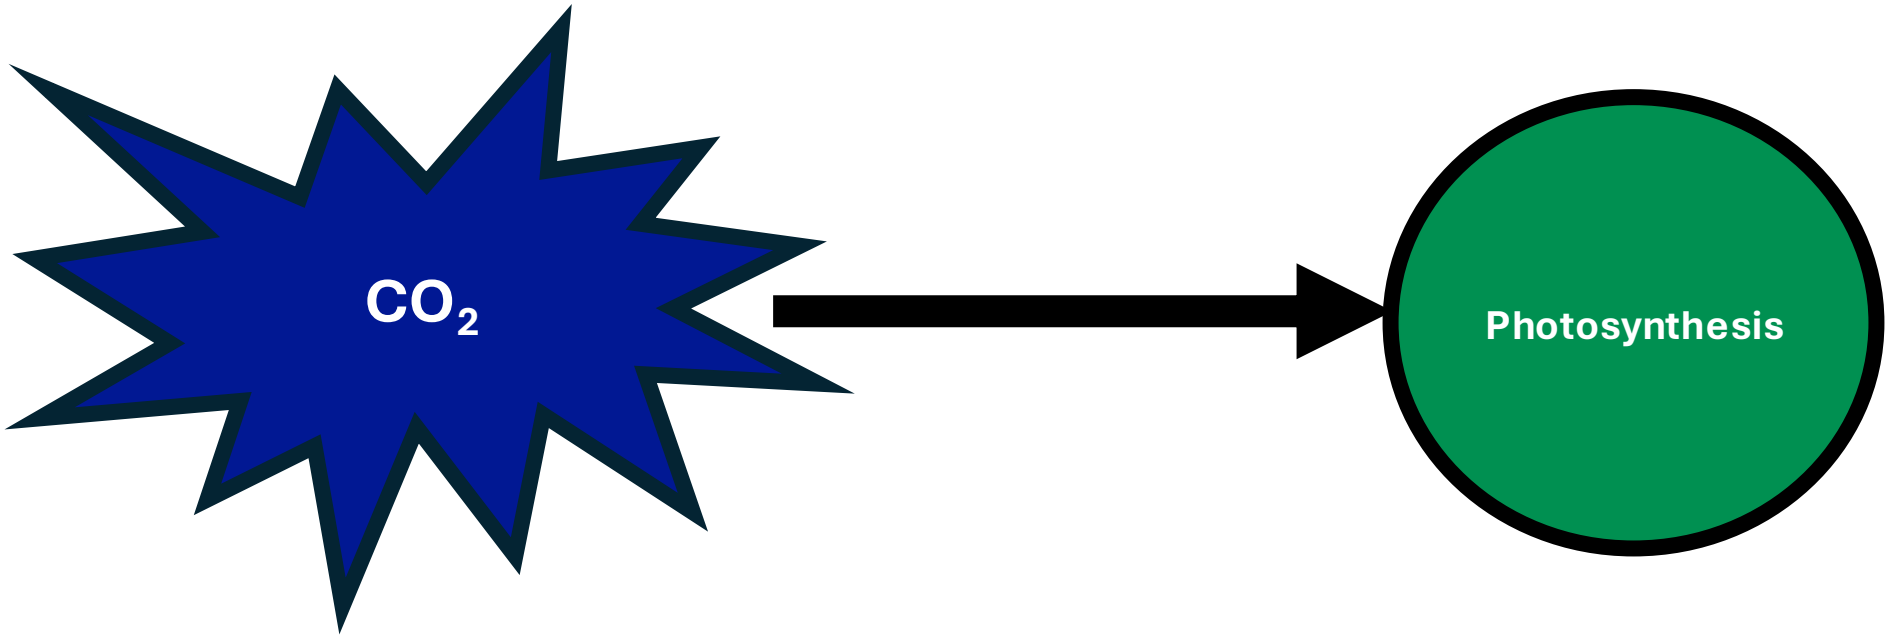

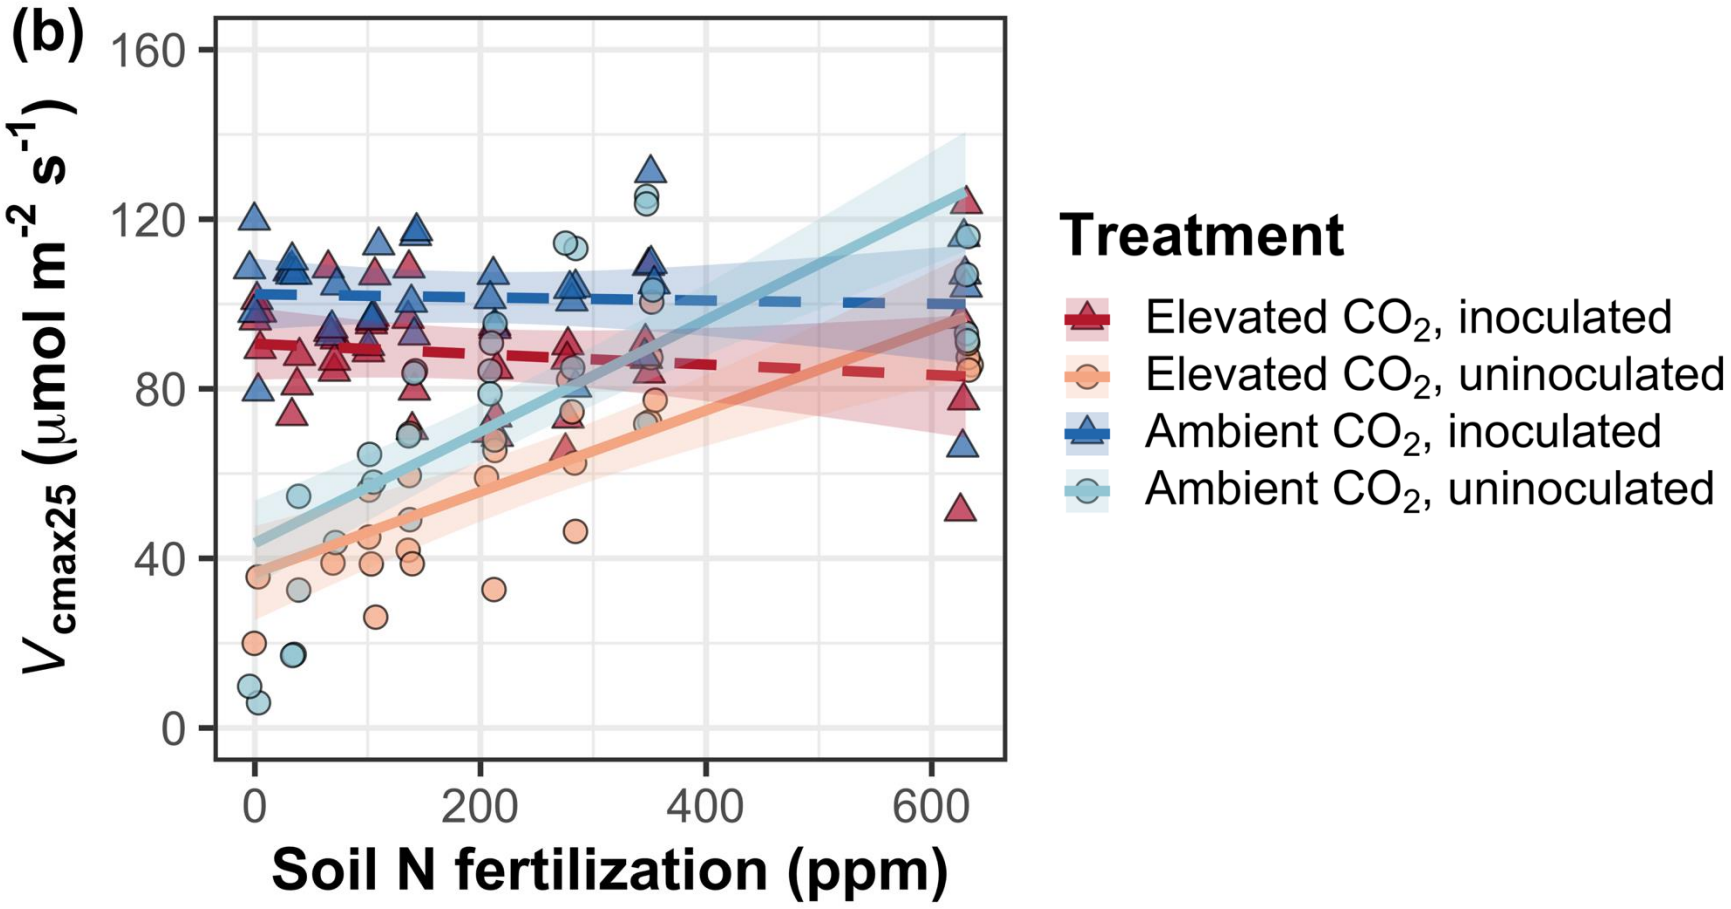

Smith et al. (2017) *JAMES*

Perturbation vignettes

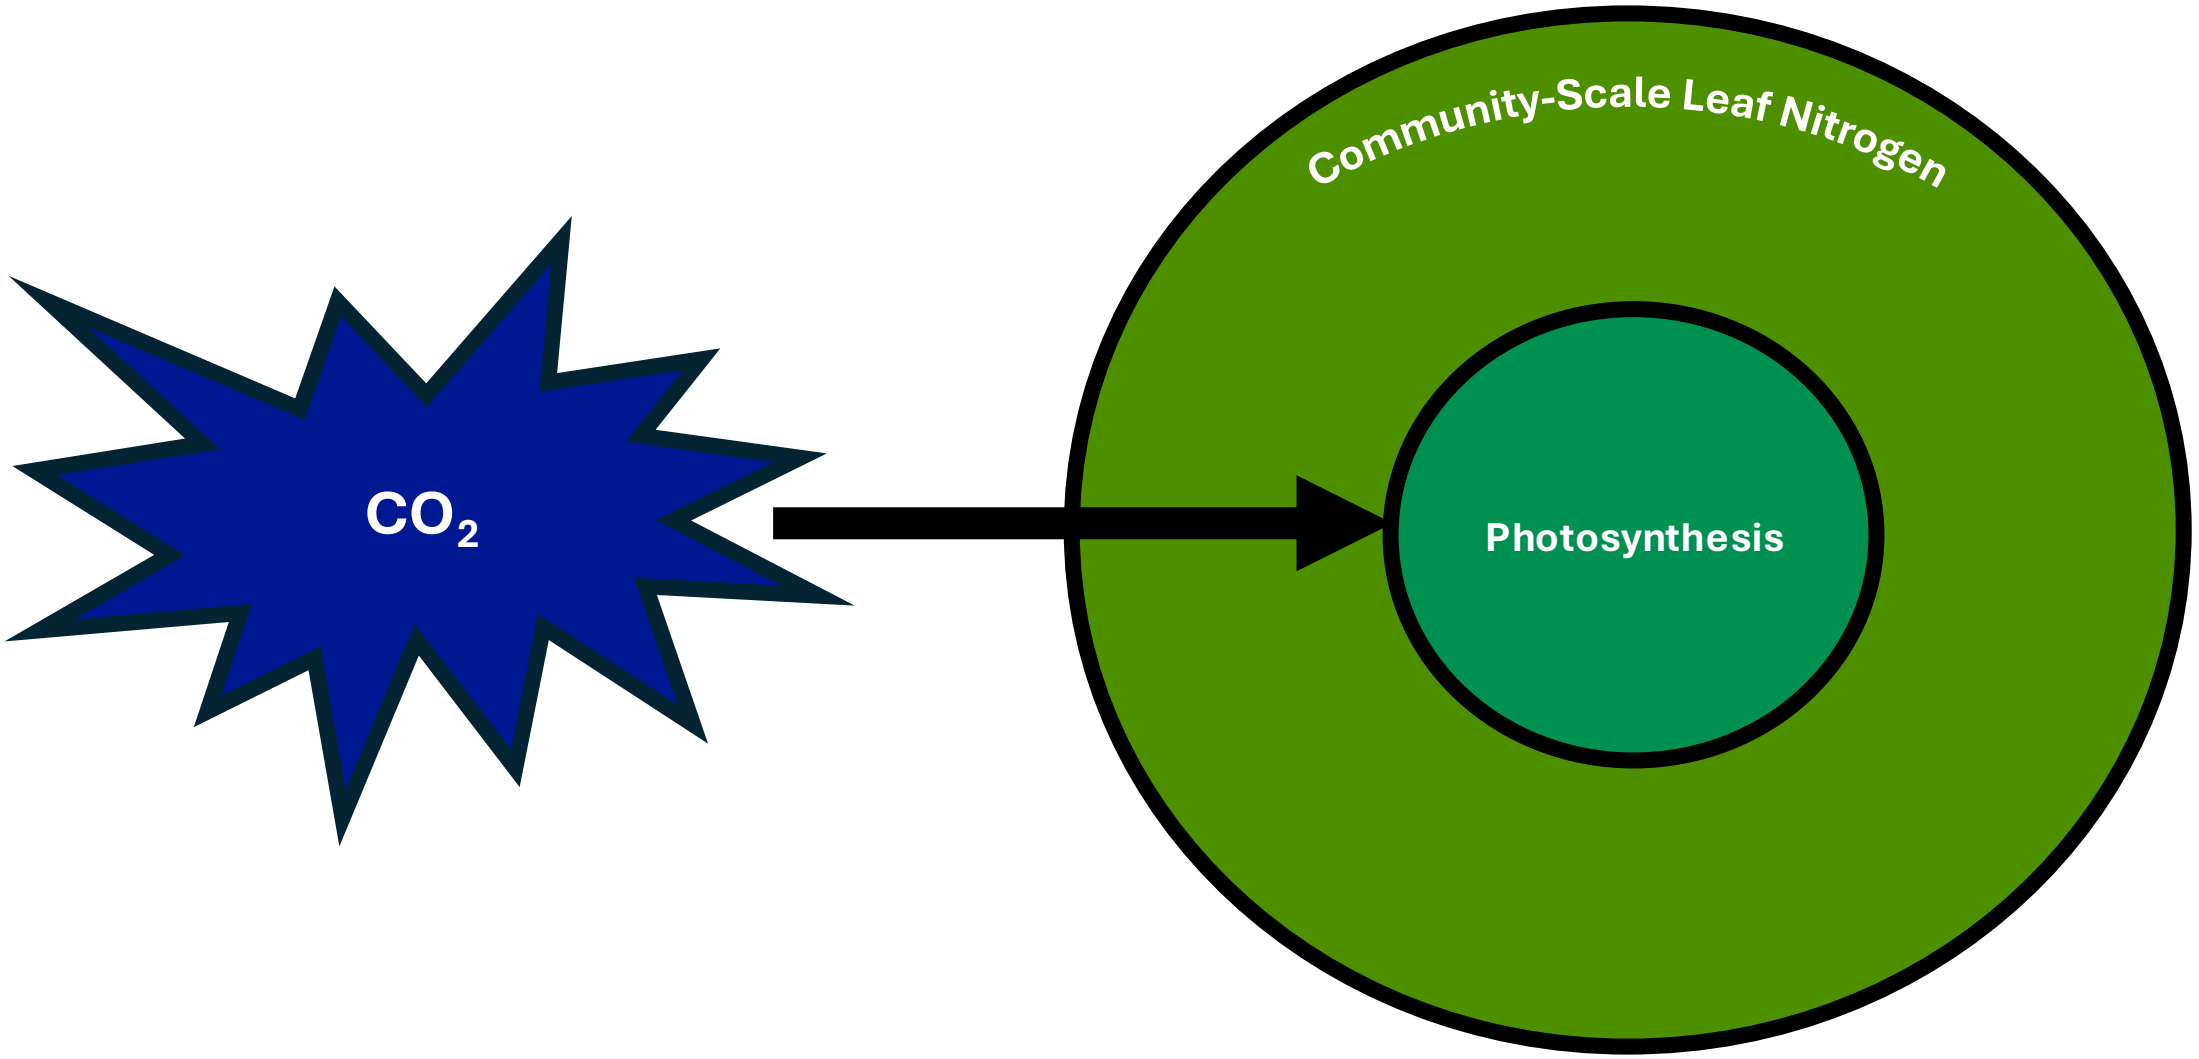

- Temperature → global carbon and energy fluxes
- **CO_2 → plant-nutrient dynamics**
- Soil fertility → population dynamics
- Environmental heterogeneity → community dynamics
- Invasion → mycorrhizal symbioses

CO_2
Photosynthesis

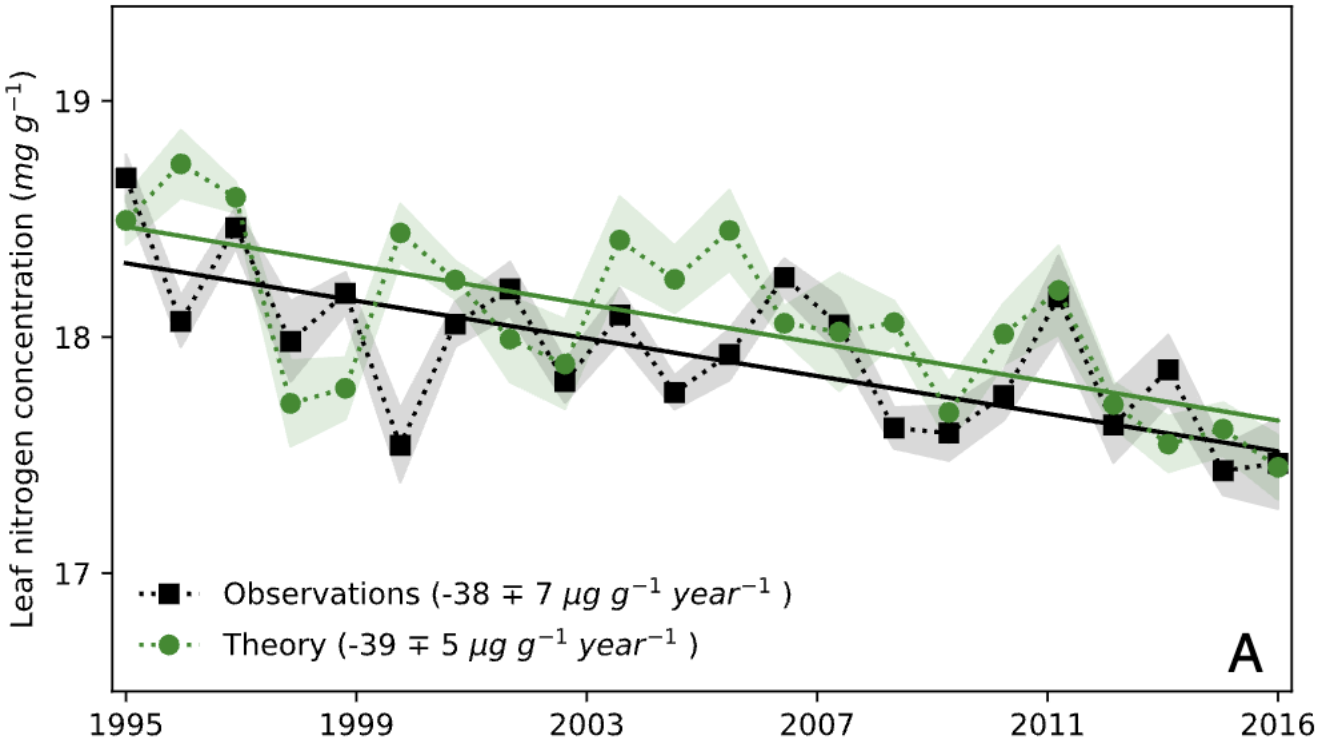

Elevated CO_2 reduces leaf nitrogen demand regardless of nitrogen availability

Perkowski, Ezekannagha, Smith (2025) *J Exp Bot*

CO_2
Community-Scale Leaf Nitrogen
Photosynthesis

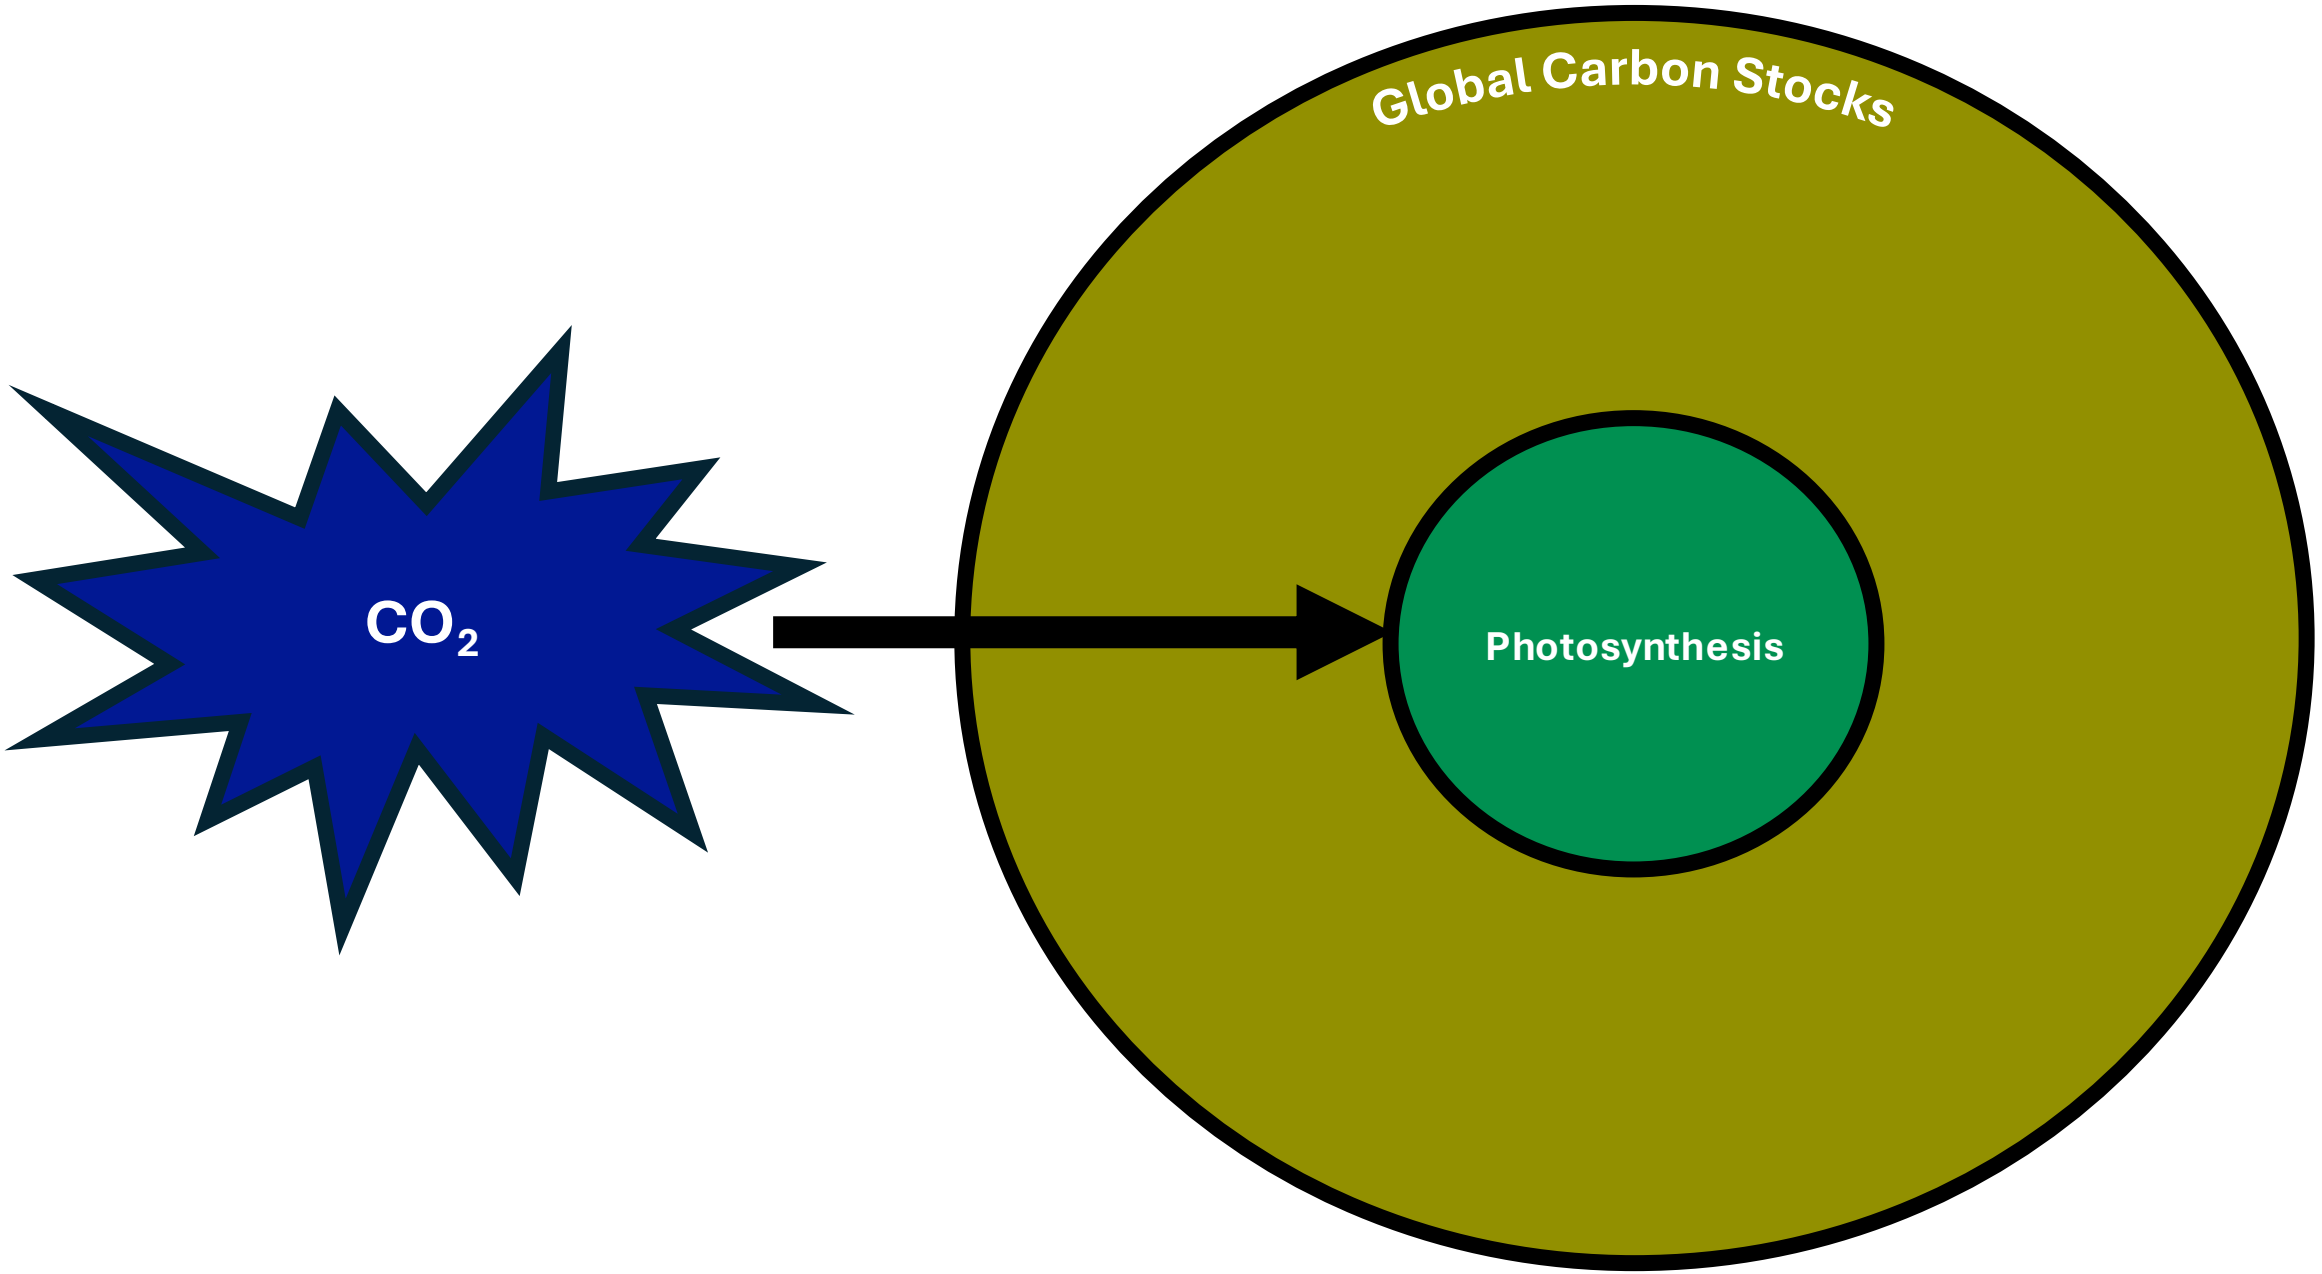

This is predictable over continental gradients

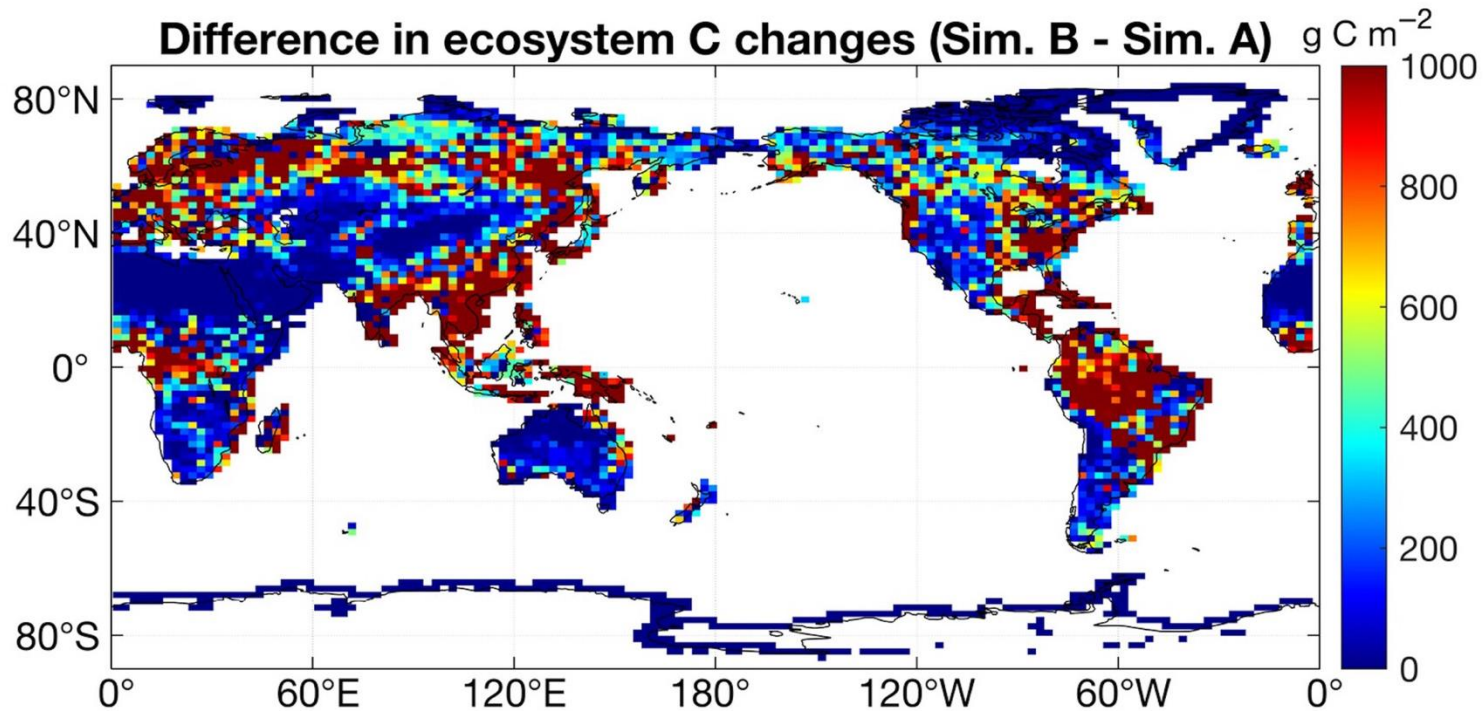

Bassiouni, Smith, et al. (2025) *PNAS*

Global Carbon Stocks
CO_2
Photosynthesis

Accounting for this effect in models increases simulated future global carbon stocks

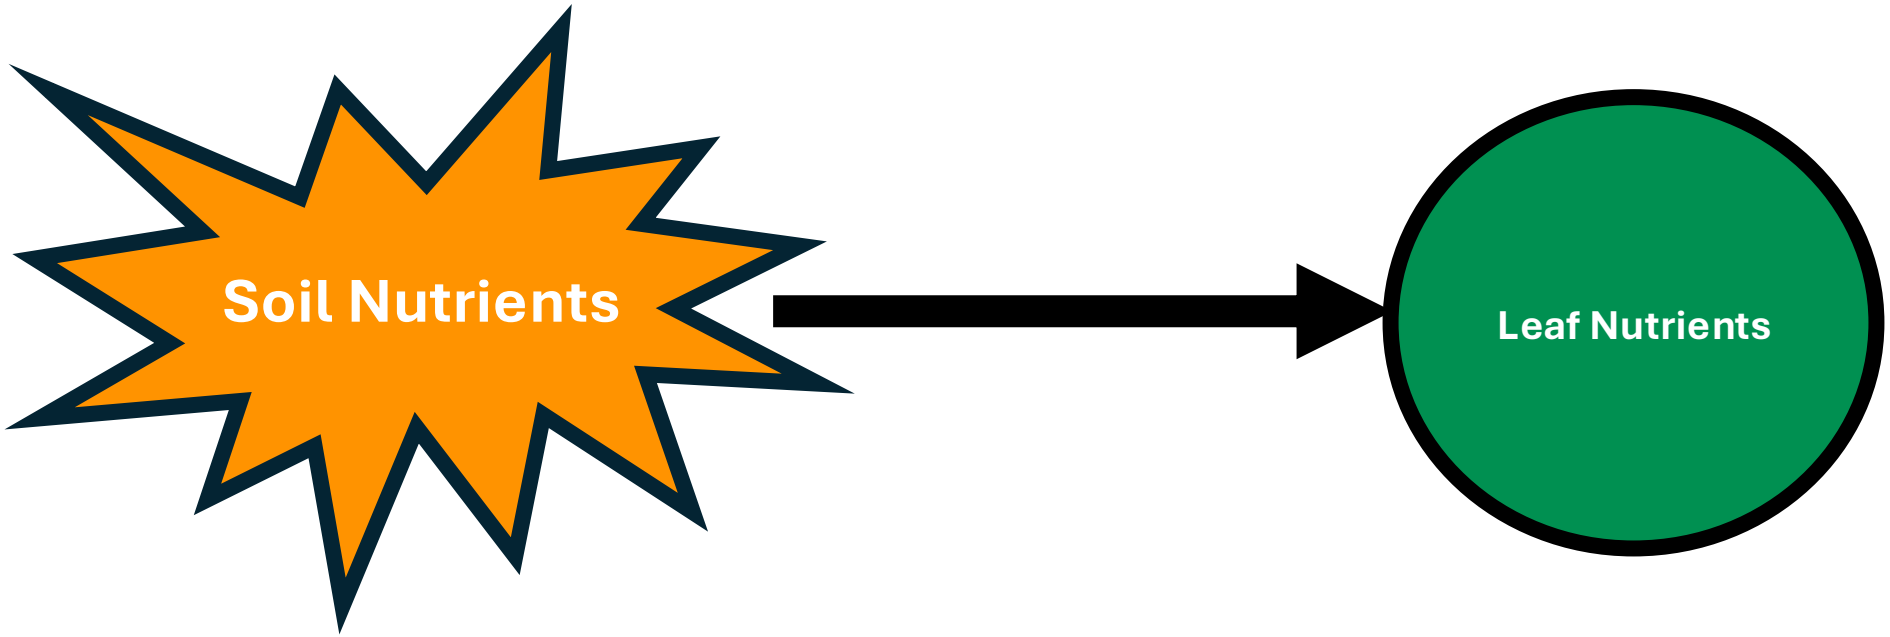

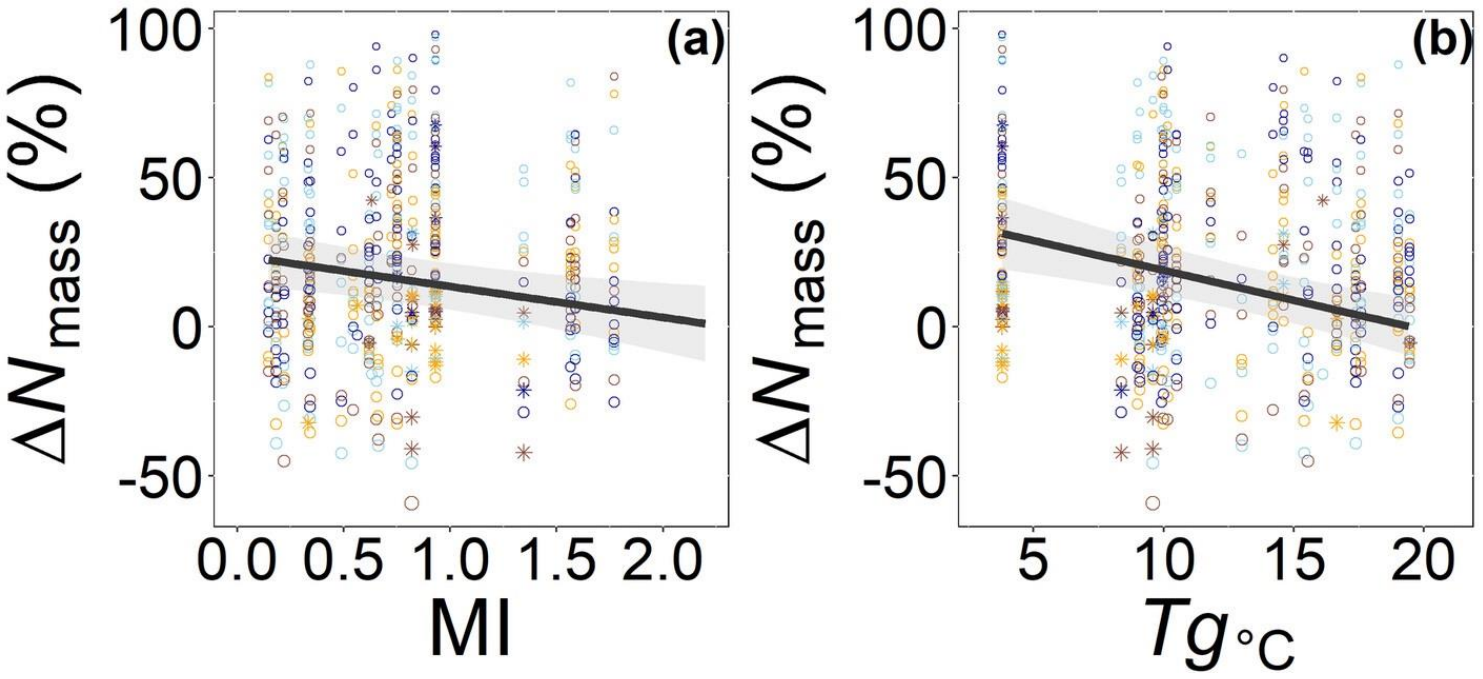

Smith et al. (2024) *Glob Change Biol*

Perturbation vignettes

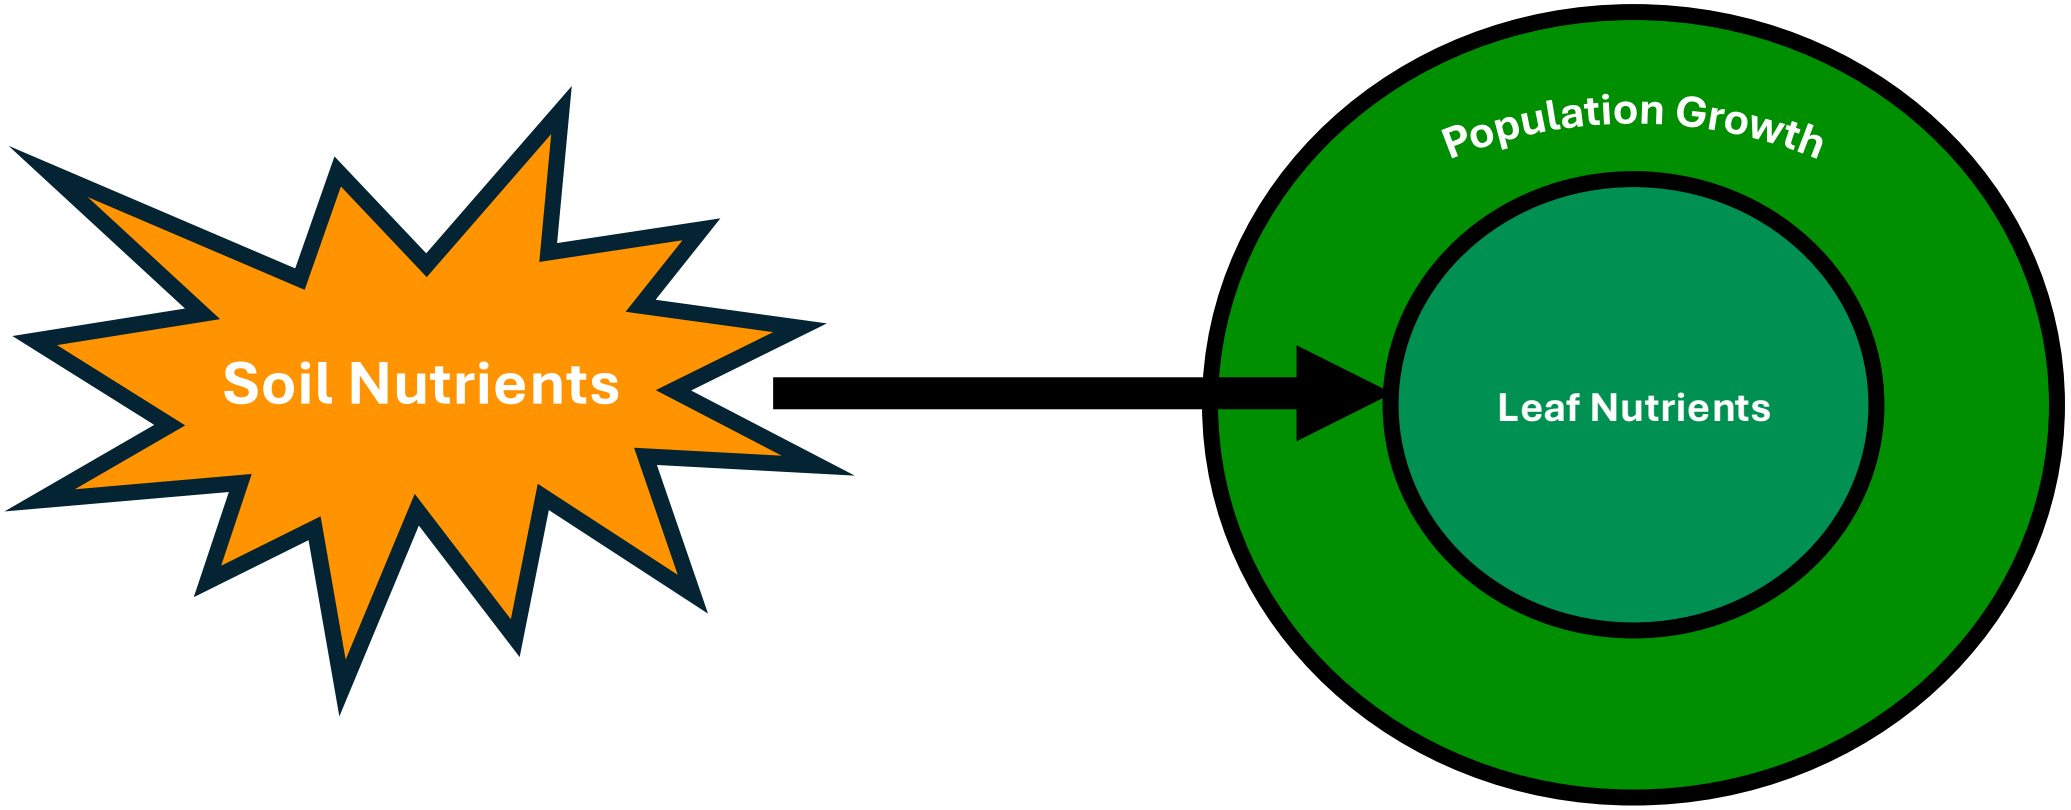

- Temperature → global carbon and energy fluxes
- CO_2 → plant-nutrient dynamics
- **Soil fertility → population dynamics**
- Environmental heterogeneity → community dynamics
- Invasion → mycorrhizal symbioses

Soil Nutrients
Leaf Nutrients

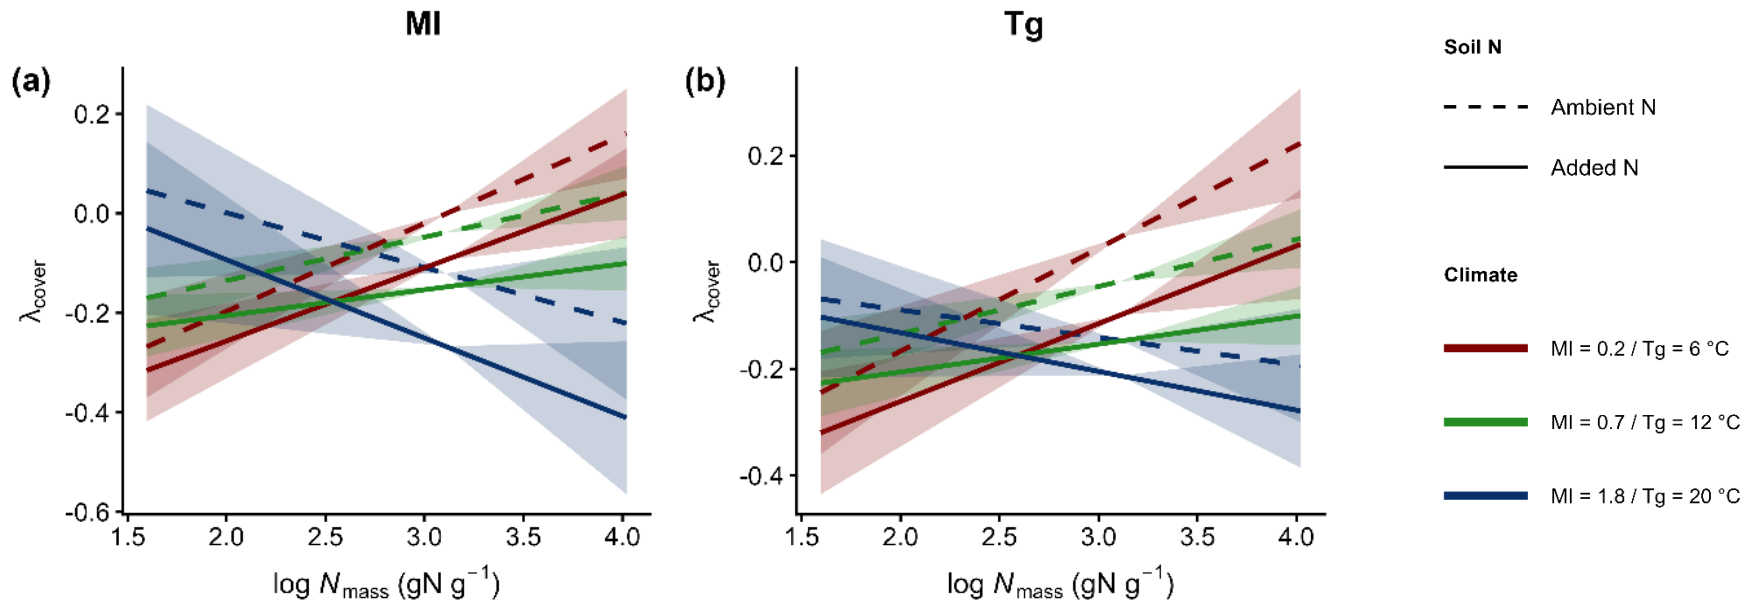

Soil nutrients enhance leaf nutrients where photosynthetic demand is greatest (dry/cold)

Cheaib…and Smith (2025) *Ecol Letters*

Soil Nutrients
Population Growth
Leaf Nutrients

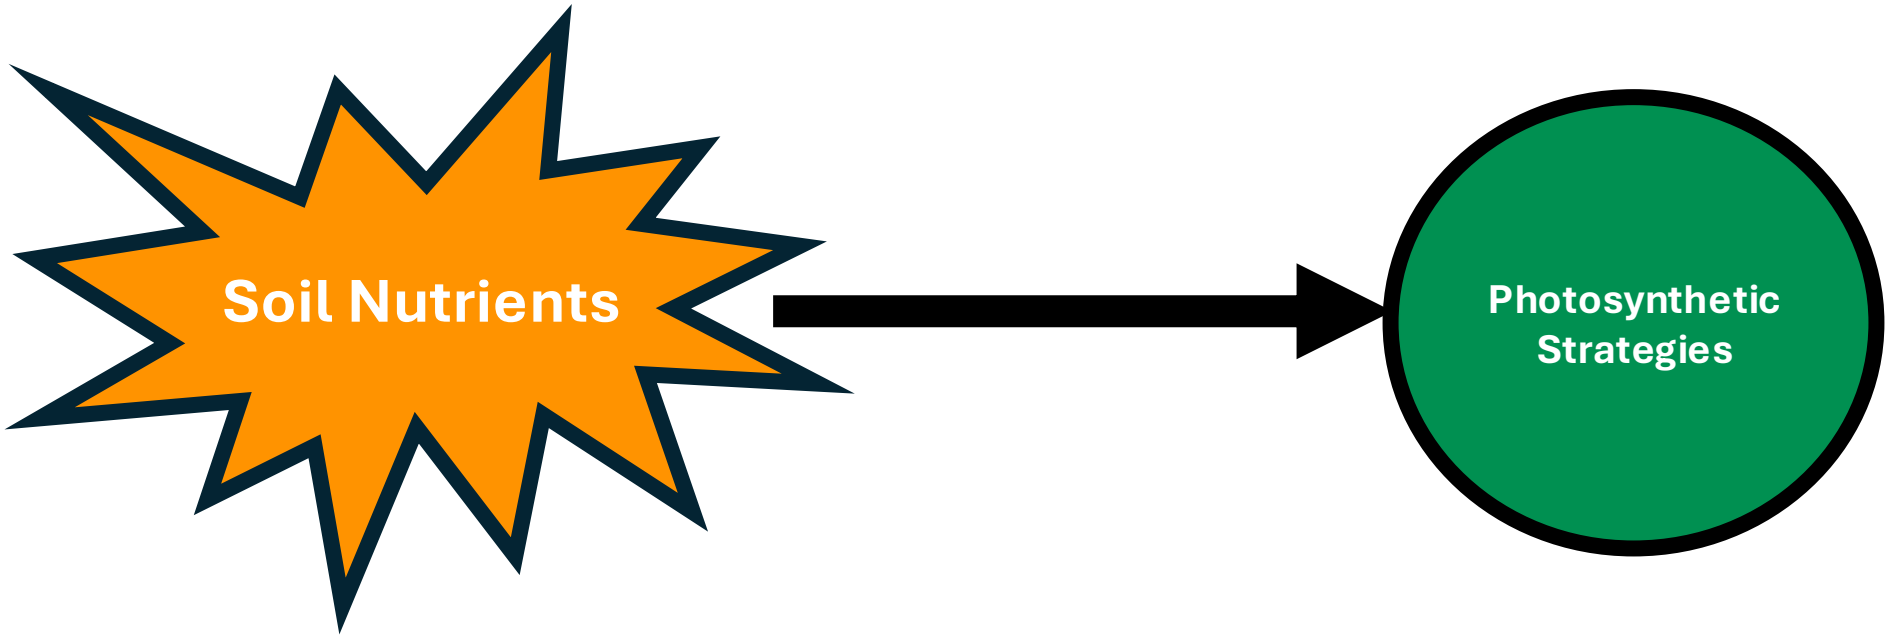

In cold/dry places, higher leaf nitrogen confers greater species population growth

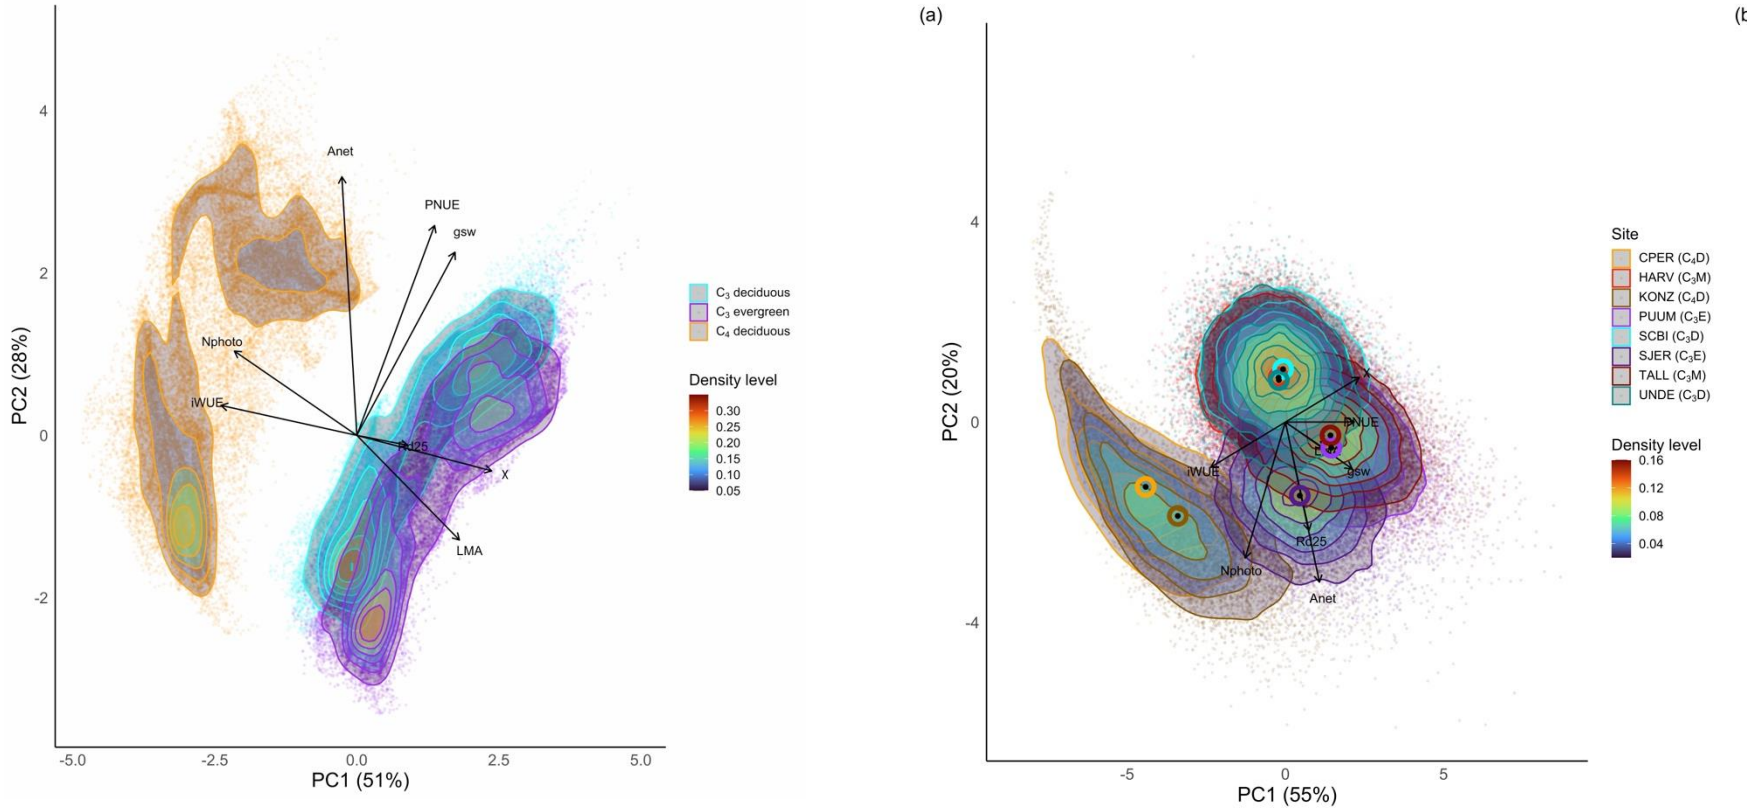

Cheaib…and Smith (in Prep)

Perturbation vignettes

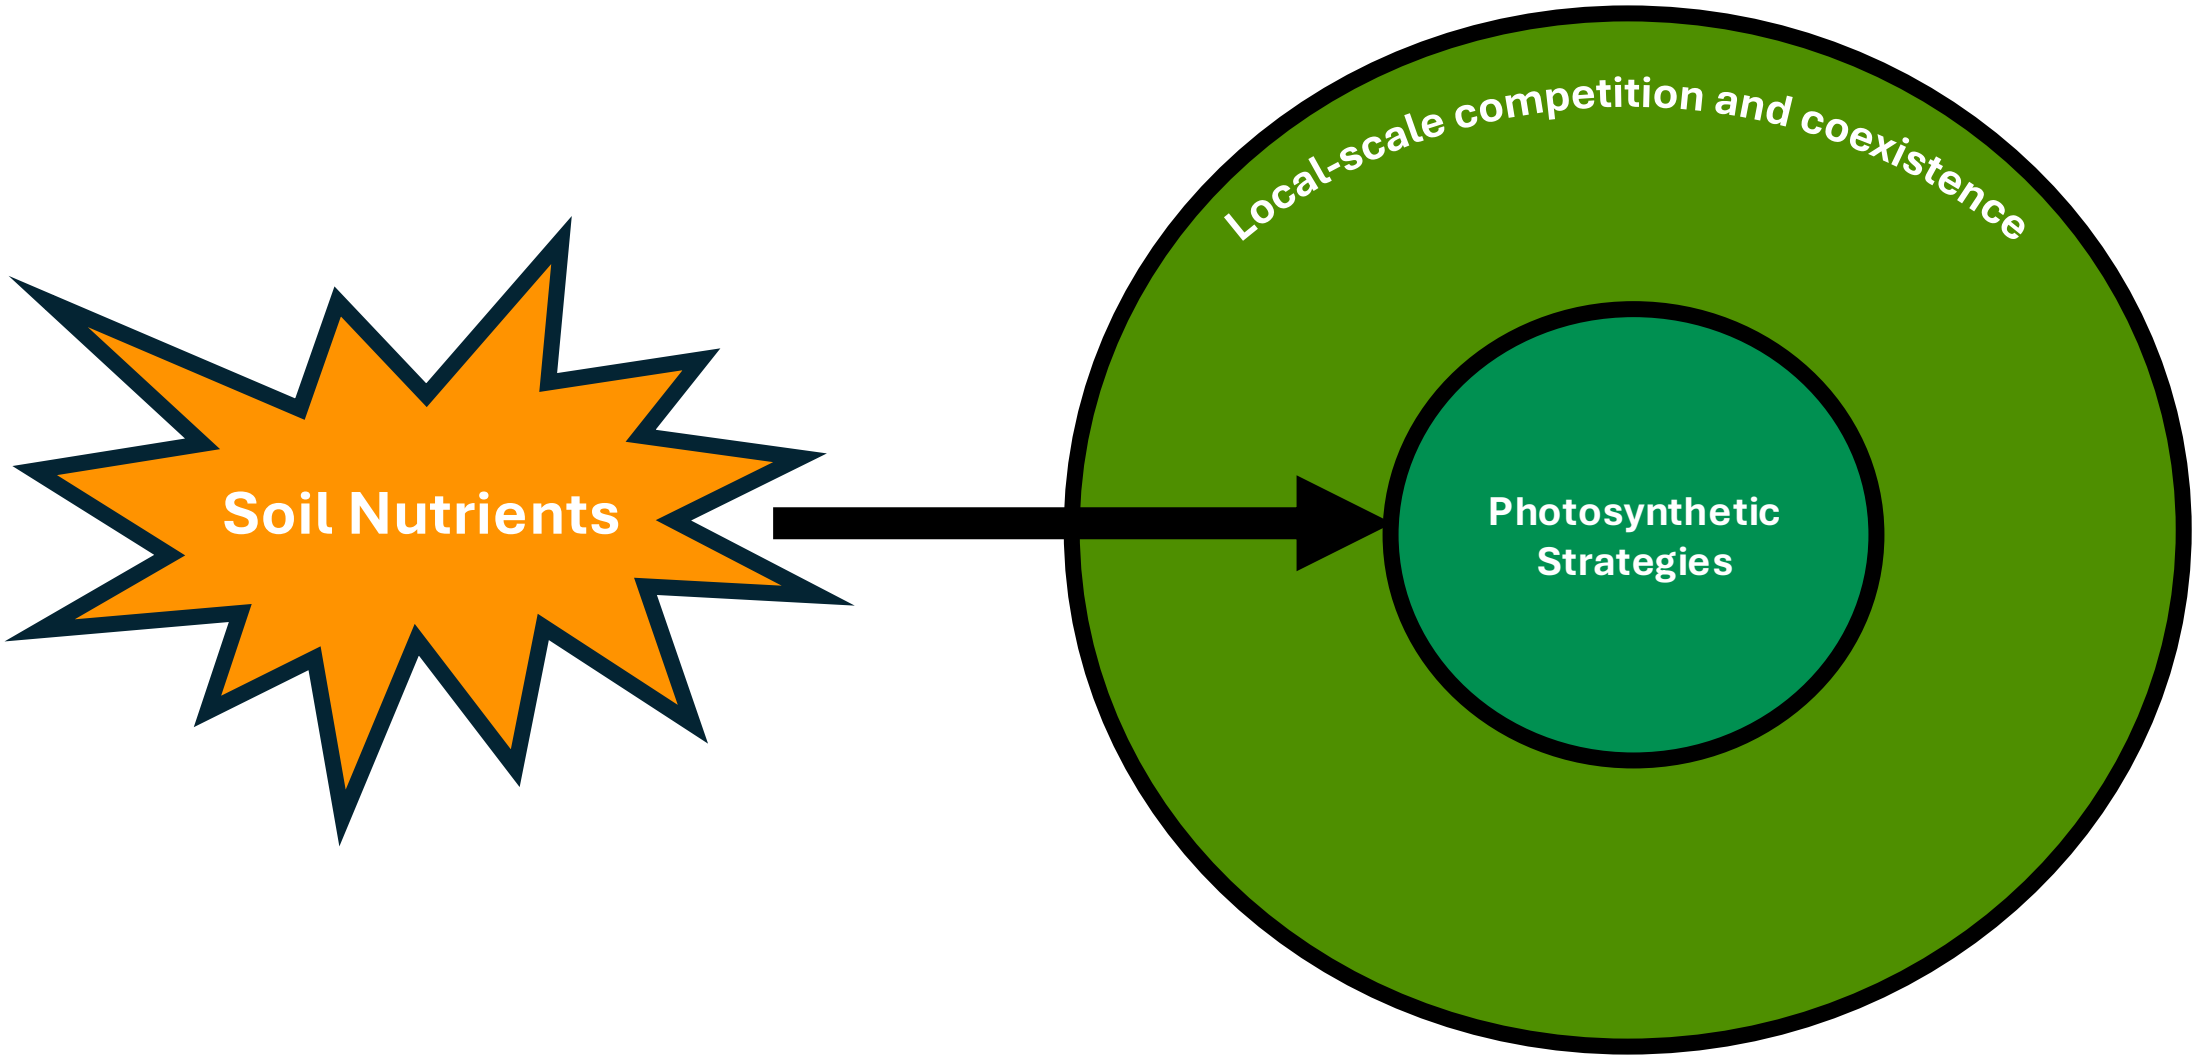

- Temperature → global carbon and energy fluxes
- CO_2 → plant-nutrient dynamics
- Soil fertility → population dynamics
- **Environmental heterogeneity → community dynamics**
- Invasion → mycorrhizal symbioses

Soil Nutrients
Photosynthetic Strategies

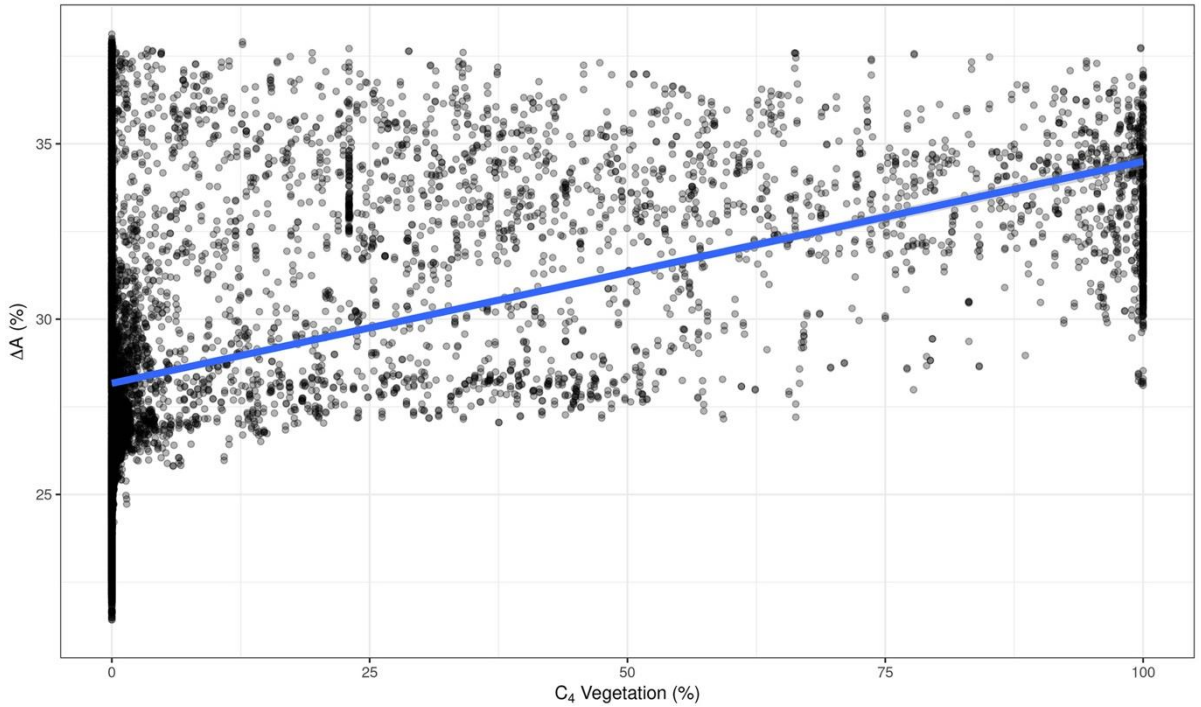

We can predict global and local photosynthetic strategies from theory

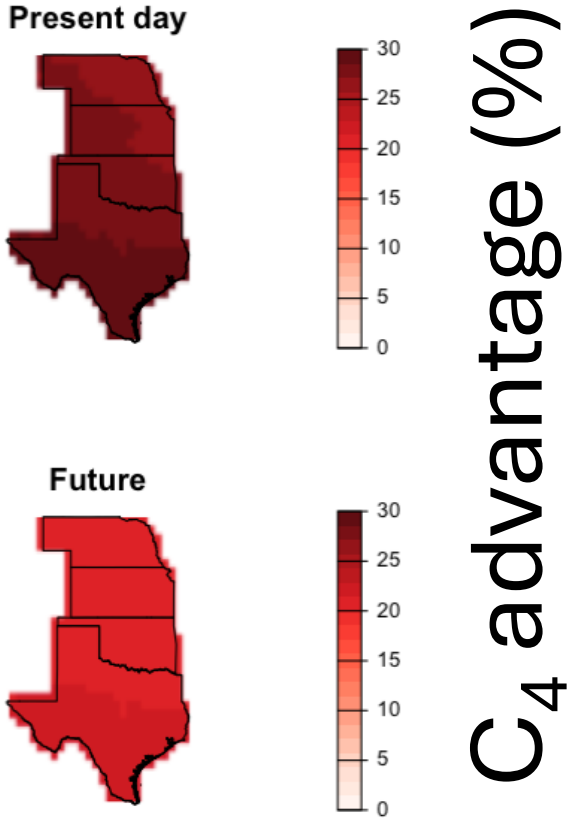

Smith (In Review)

Soil Nutrients
Local-scale competition and coexistence
Photosynthetic Strategies

Strategies can predict observable outcomes of competition (broadly)

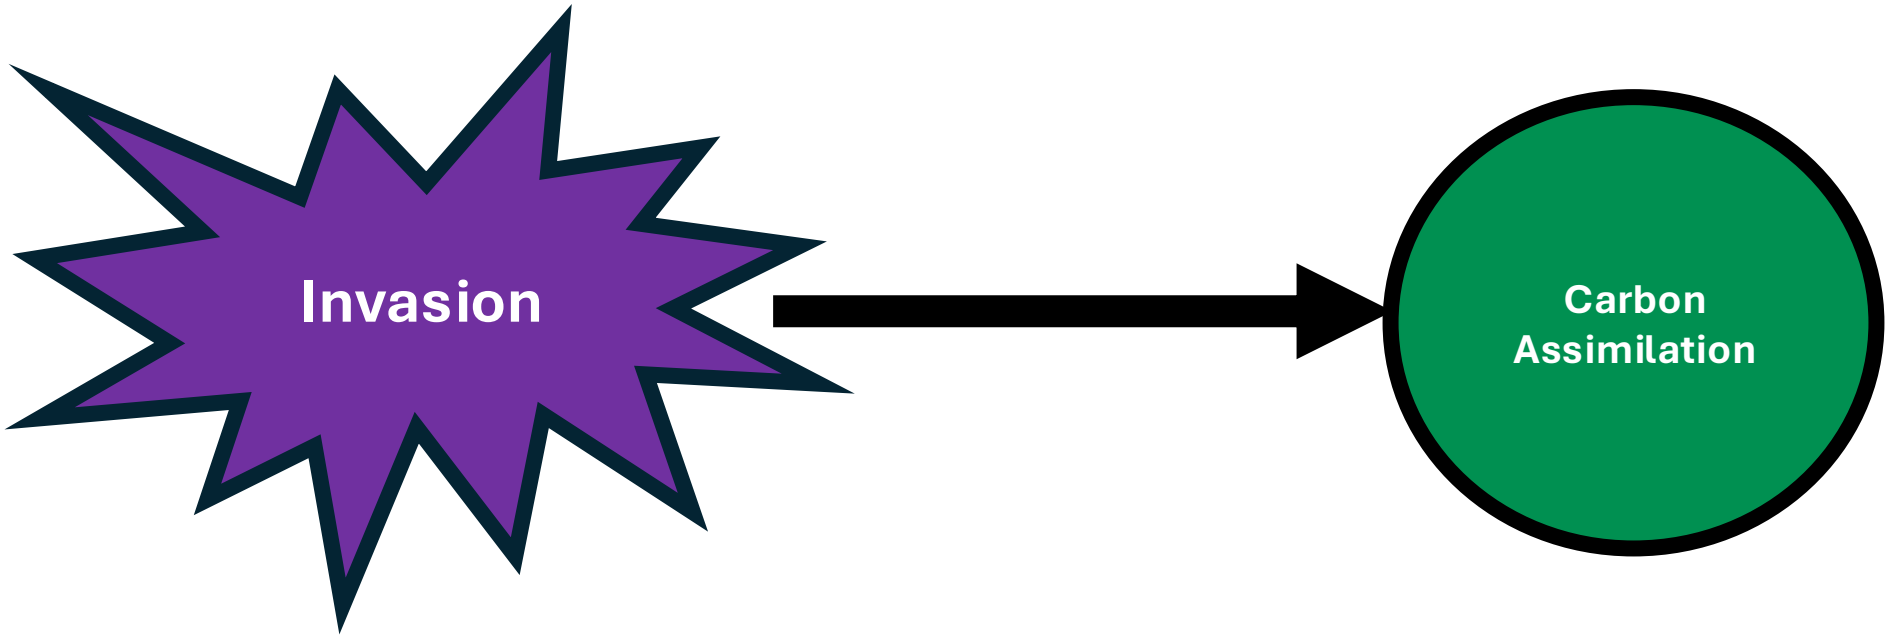

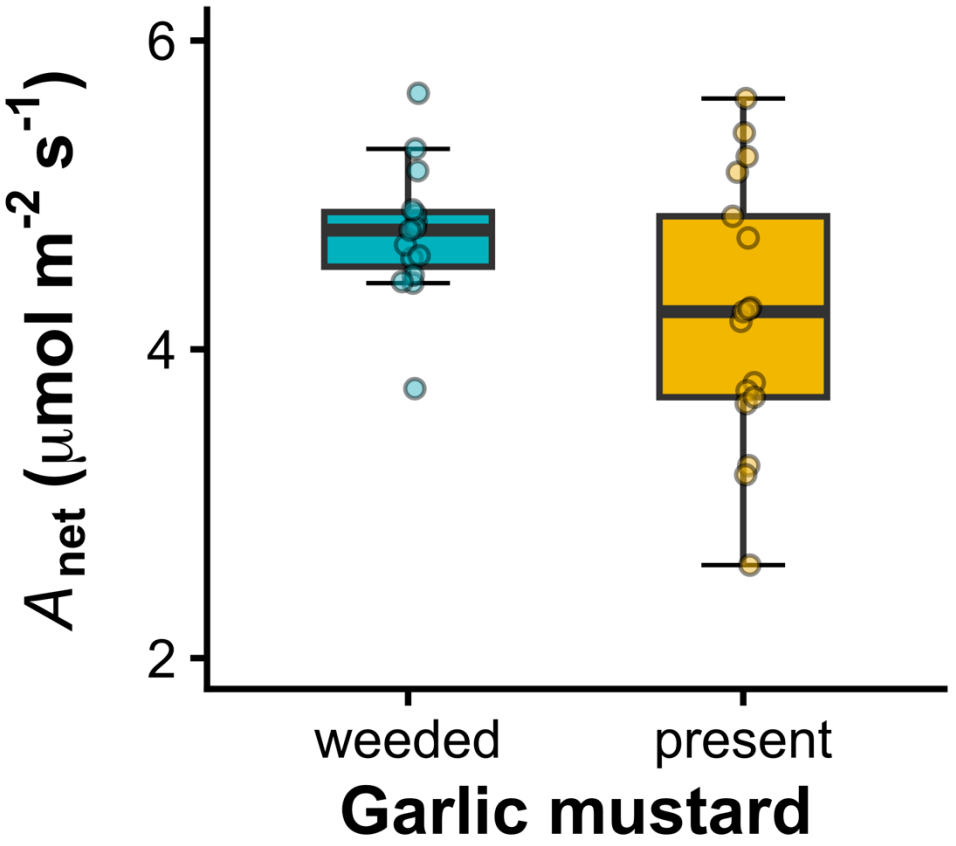

Scott and Smith (2022) *JAMES*

Perturbation vignettes

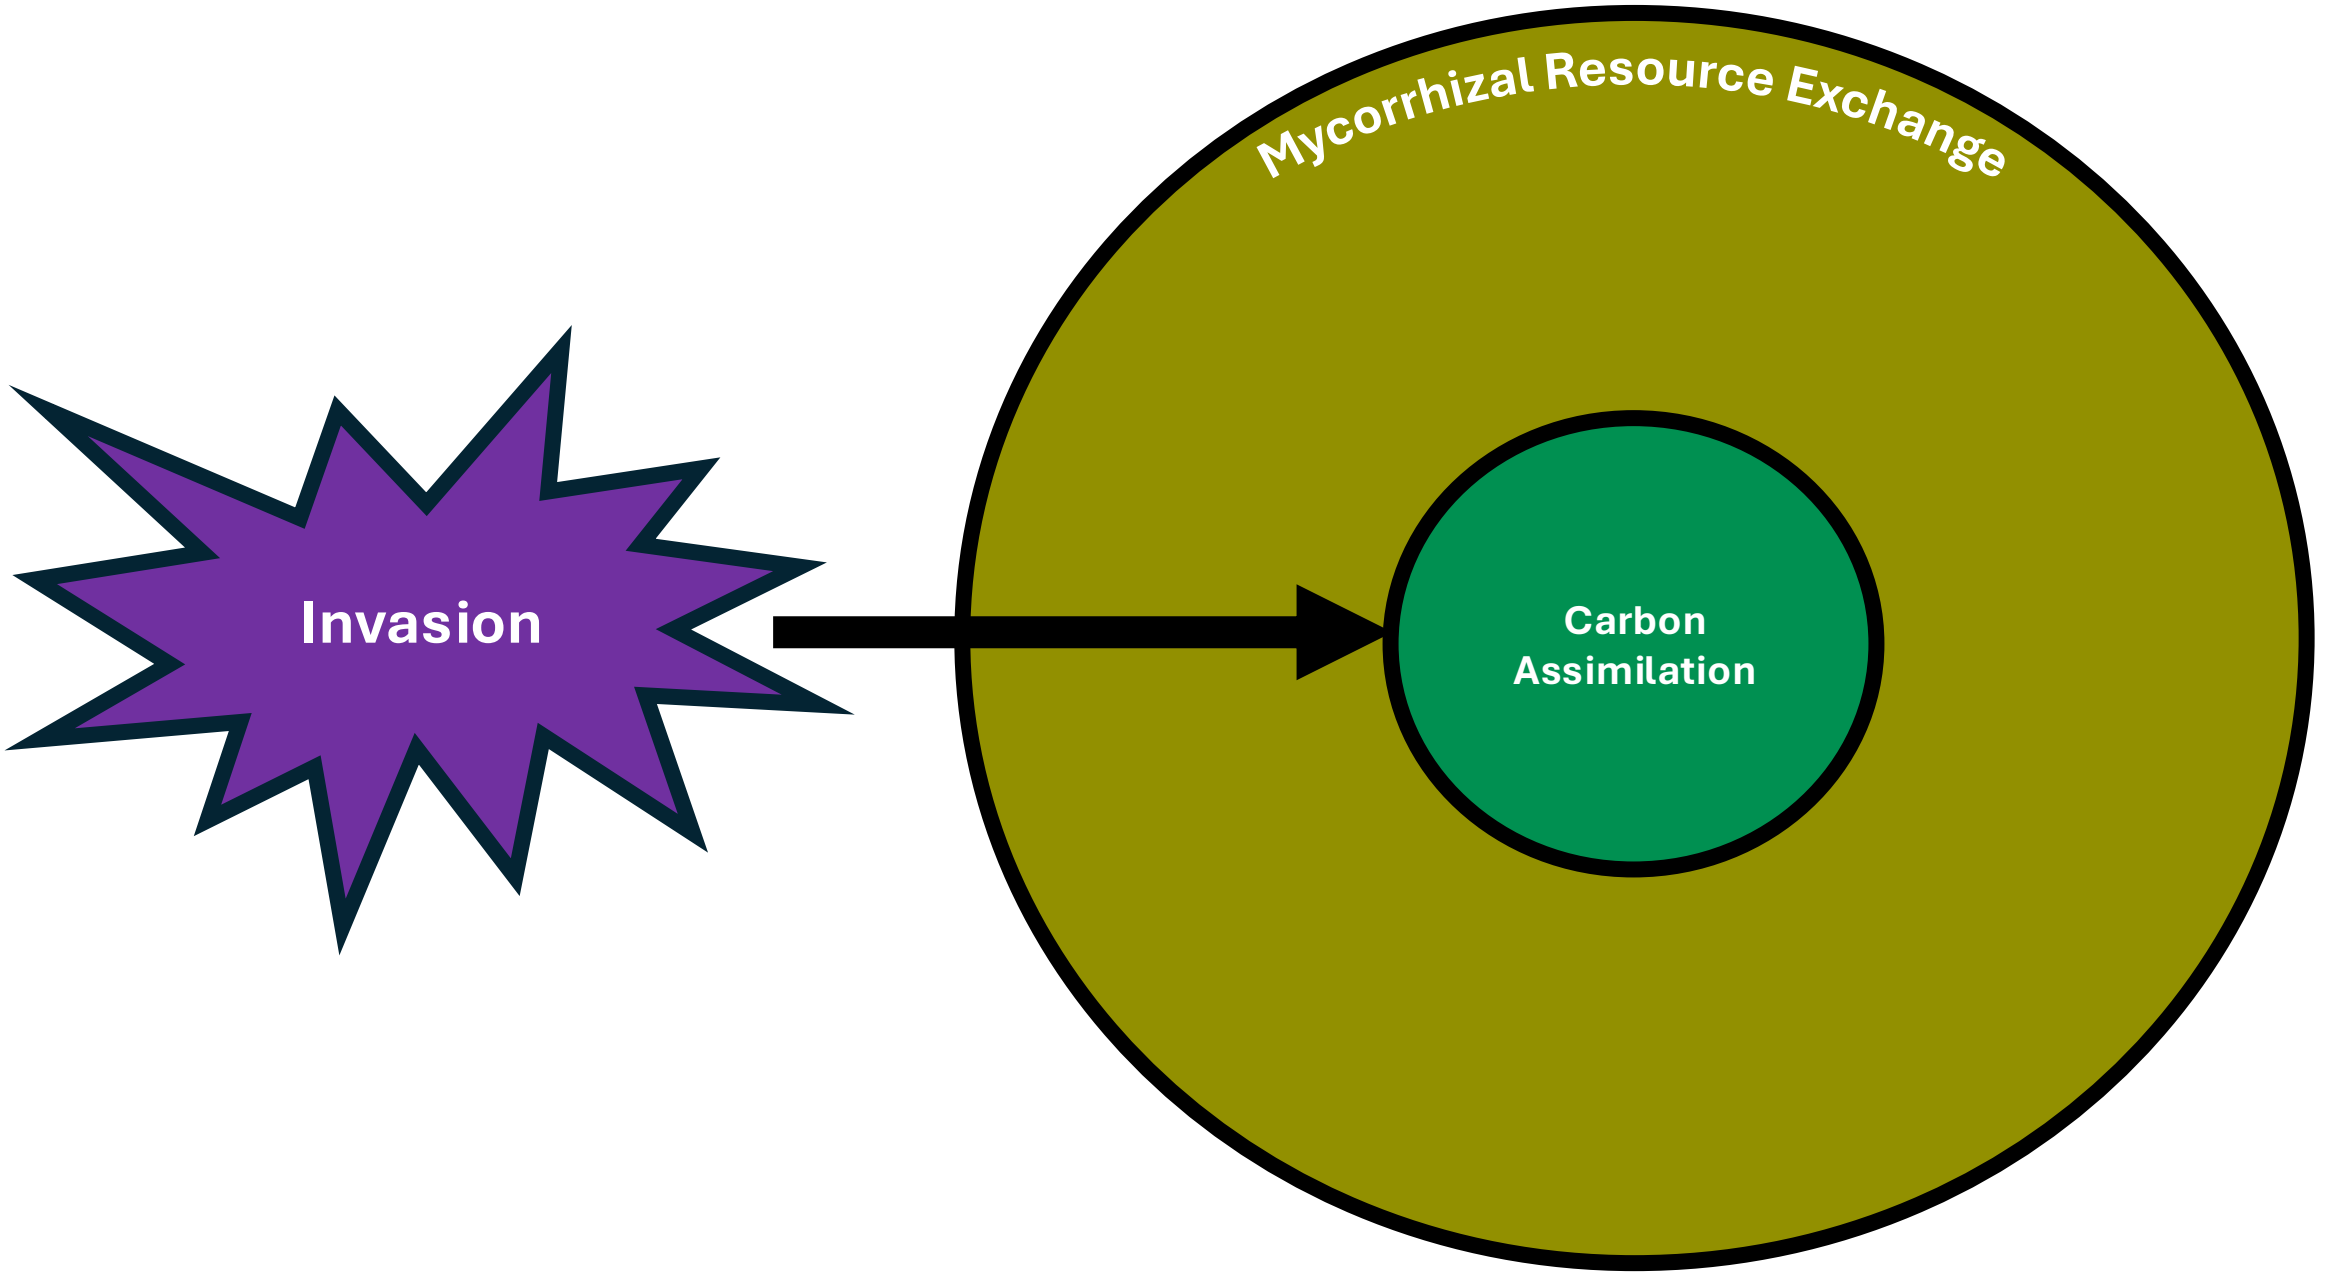

- Temperature → global carbon and energy fluxes
- CO_2 → plant-nutrient dynamics
- Soil fertility → population dynamics
- Environmental heterogeneity → community dynamics
- **Invasion → mycorrhizal symbioses**

Invasion
Carbon
Assimilation

Invasion by garlic mustard reduces native understory plant carbon assimilation

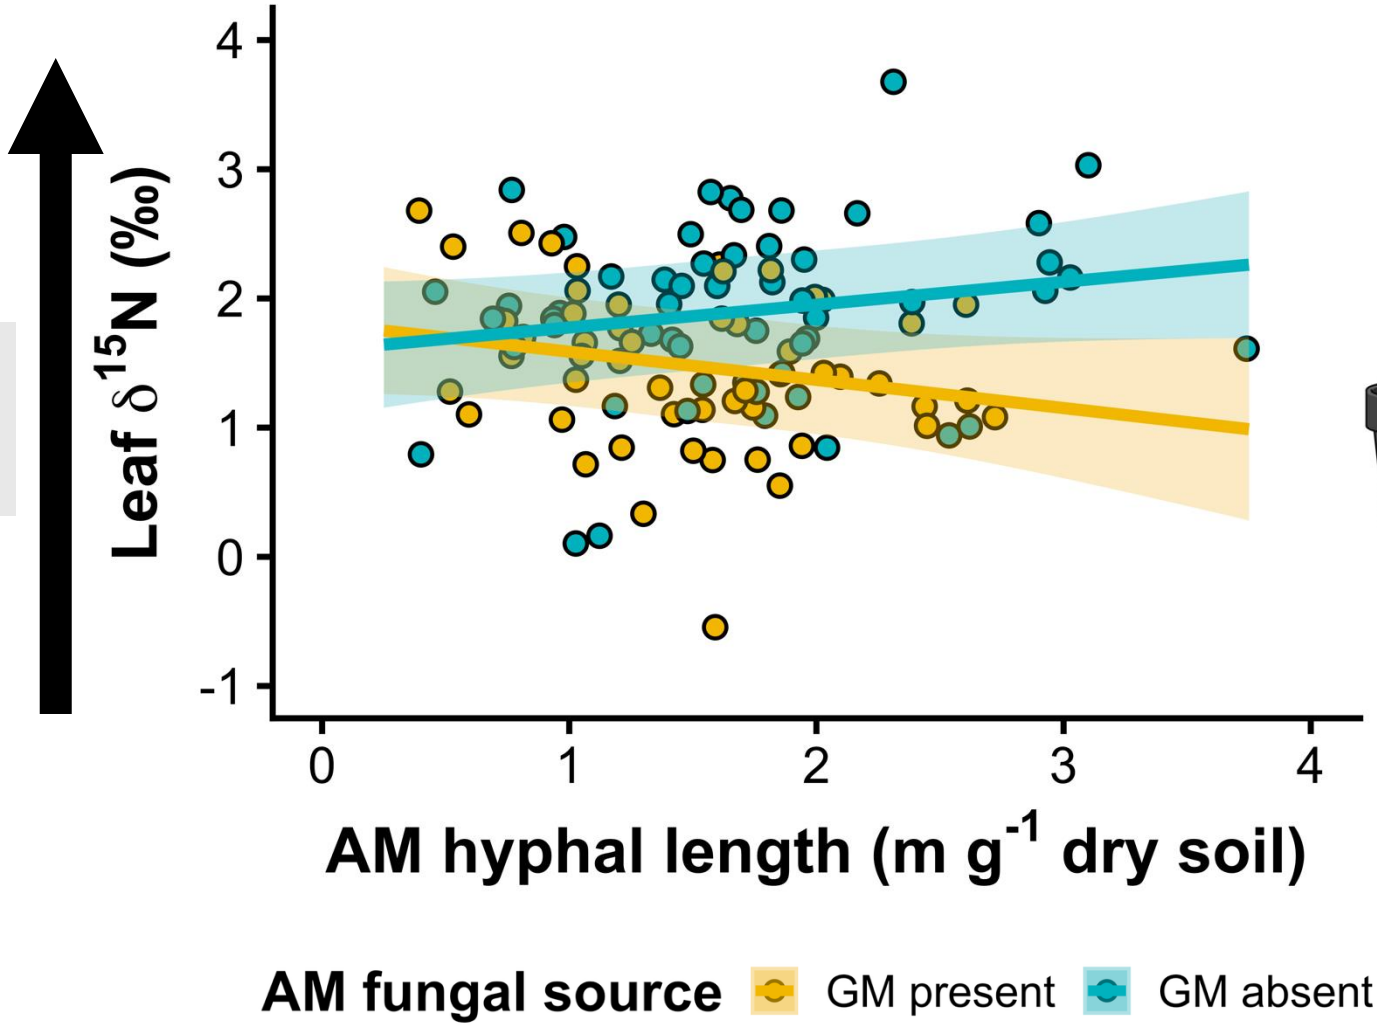

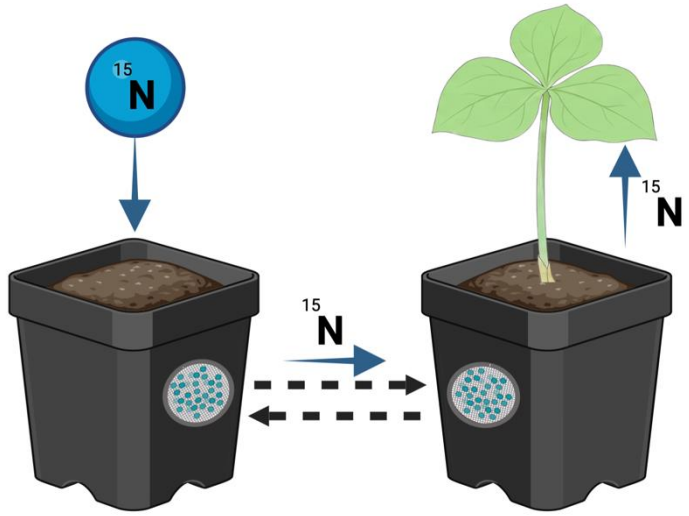

Perkowski…and Smith (2026) *Func Ecol*

Mycorrhizal Resource Exchange
Invasion
Carbon
Assimilation

Invasion impacts are due to mycorrhizal mutualism disruption

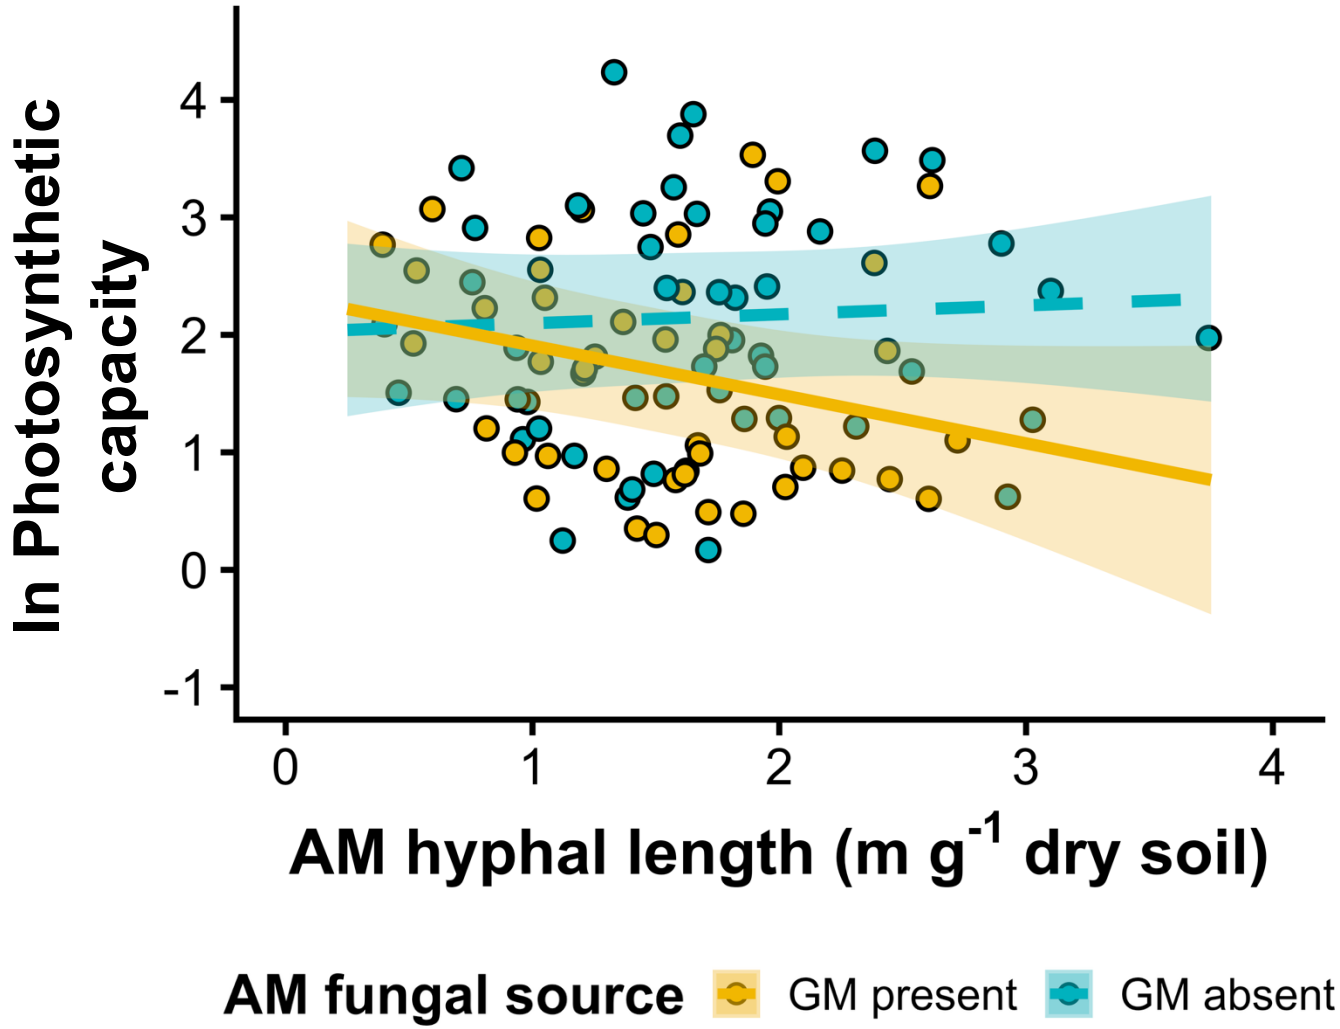

Greater share of leaf N from AM fungi

Perkowski…and Smith (In Prep)

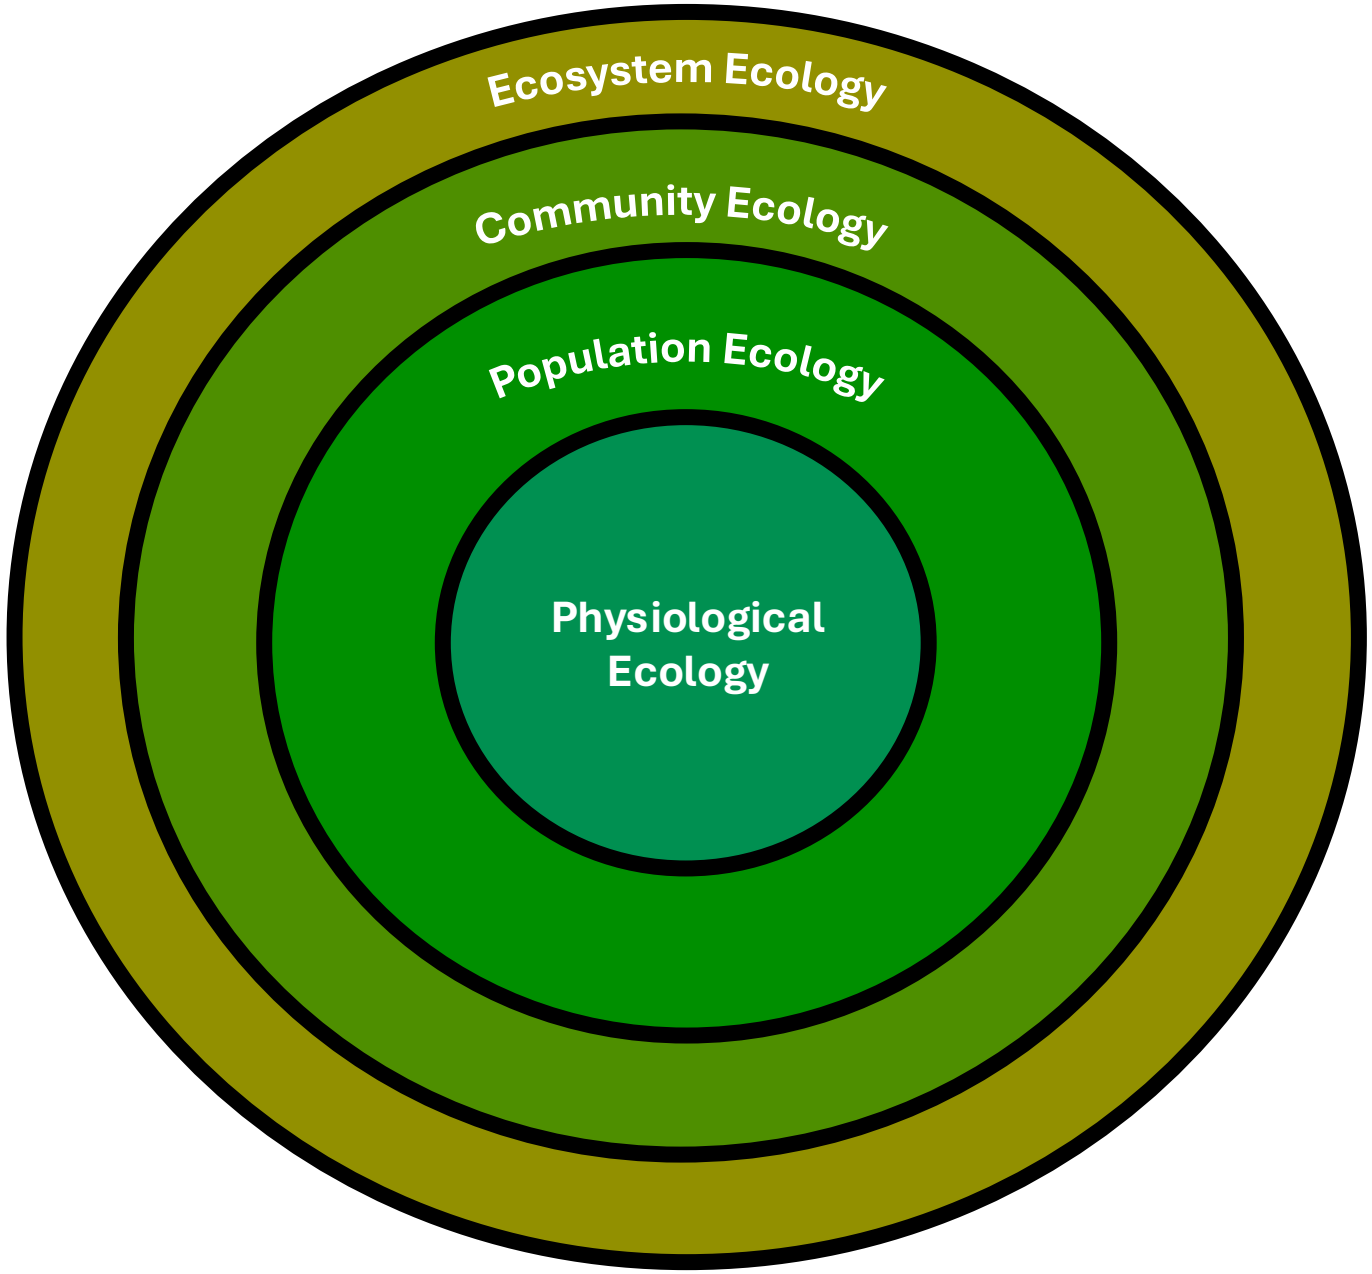

Invasion impacts are due to mycorrhizal mutualism disruption

Perkowski…and Smith (In Prep)

Conclusions

- Plant physiological responses to their environment form the basis of larger-scale responses
- Experiments, observations, theory, and modeling are needed to understand and predict these responses across scales
